

4-1-1 [JP] An insulated electric water heater operates at steady state at a constant pressure of 150 kPa, supplying hot water at a flow rate of 0.5 kg/s. If the inlet temperature is 20°C and the exit temperature is maximized without creating any vapor, determine (a) the electrical power consumption, (b) the temperature of the water leaving the heater, (c) the volume flow rate in L/min at the inlet, and (d) the volume flow rate in L/min at the exit. Use the PC model for water.

SOLUTION

Let state-1 represent the inlet and state-2 the exit state

State-1 (given p_1, T_1):

$$h_1 = 84.11 \frac{\text{kJ}}{\text{kg}}; \quad v_1 = 0.0010 \frac{\text{m}^3}{\text{kg}};$$

State-2 (given $p_2 = p_1, x_2$):

$$T_2 = T_{\text{sat}} = 111.34^\circ \text{C};$$

$$h_2 = h_f = 467.00 \frac{\text{kJ}}{\text{kg}};$$

$$v_2 = 0.00105 \frac{\text{m}^3}{\text{kg}};$$

(a) From the energy balance equation, we have

$$\dot{W}_{\text{el}} = \dot{m}(j_1 - j_2);$$

$$\Rightarrow \dot{W}_{el} = \dot{m}(h_1 - h_2); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta ke = \Delta pe \cong 0)$$

$$\Rightarrow \dot{W}_{el} = 0.5(84.11 - 467.00);$$

$$\Rightarrow \dot{W}_{el} = -191.44 \text{ kW} \therefore \dot{W}_{el, in} = 191.44 \text{ kW}$$

$$(b) \quad T_2 = 111.34^\circ\text{C}$$

$$(c) \quad \dot{V}_1 = \dot{m}v_1; \quad \Rightarrow \dot{V}_1 = (0.5)(0.0010); \quad \Rightarrow \dot{V}_1 = 5 \times 10^{-4} \frac{\text{m}^3}{\text{s}}; \quad \Rightarrow \dot{V}_1 = 30.06 \frac{\text{L}}{\text{min}}$$

$$(d) \quad \dot{V}_2 = \dot{m}v_2; \quad \Rightarrow \dot{V}_2 = (0.5)0.00105; \quad \Rightarrow \dot{V}_2 = 5.3 \times 10^{-4} \frac{\text{m}^3}{\text{s}}; \quad \Rightarrow \dot{V}_2 = 31.59 \frac{\text{L}}{\text{min}}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-2 [JU] A steam heating system for a building 175 m high is supplied from a boiler 20 m below ground level. Dry, saturated steam is supplied from the boiler at 300 kPa, which reaches the top of the building at 250 kPa. Heat losses from the supply line to the surroundings is 50 kJ/kg. Determine (a) the quality of steam at the 175 m elevation. Neglect any change in ke. (b) **What-if scenario:** How would the answer change if the change in pe was neglected in the analysis?

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, x_1, z_1):

$$h_1 = 2724.9 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given p_2, z_2):

$$T_{\text{sat}} = 127.41^\circ\text{C}; \quad h_f = 535.35 \frac{\text{kJ}}{\text{kg}}; \quad h_{fg} = 2181.2 \frac{\text{kJ}}{\text{kg}};$$

From the energy balance equation on the steady turbine, we have

$$-\dot{Q} = \dot{m}(j_1 - j_2);$$

$$\Rightarrow -\dot{Q} = \dot{m}(h_1 - h_2 + \frac{g(z_1 - z_2)}{1000}); \quad (\text{since } \dot{W}_{\text{ext}} \cong 0, \text{ and } \Delta \text{ke} \cong 0)$$

$$\Rightarrow 50 = \left(2724.9 - h_2 + \frac{9.8(-20 - 175)}{1000} \right);$$

$$\Rightarrow h_2 = 2672.98 \frac{\text{kJ}}{\text{kg}};$$

(a) Quality of steam at exit, is

$$h_f + x_2 h_{fg} = h_2; \quad \Rightarrow x_2 = \frac{h_2 - h_f}{h_{fg}}; \quad \Rightarrow x_2 = \frac{2672.98 - 535.35}{2181.2}; \quad \Rightarrow x_2 = 98\%$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-3 [JX] Water flows steadily into a well-insulated electrical water heater (see Anim. 4-1-1) with a mass flow rate of 1 kg/s at 100 kPa and 25°C. Determine (a) the electrical power consumption if the water becomes saturated (liquid) at the exit. Assume no pressure loss, neglect changes in ke and pe , and use the SL model (use $c_v = 4.184$ kJ/kg·K for water). (b) **What-if Scenario:** What would the power consumption be if the PC model were used instead?

SOLUTION

Given:

$$c_p = c_v = c = 4.184 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, \dot{m}_1)

State-2 (given $p_2 = p_1, x_2, \dot{m}_2 = \dot{m}_1$):

$$T_{\text{sat}@100\text{kPa}} = 100^\circ\text{C};$$

(a) From the energy balance equation, we have

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{W}_{el} = \dot{m}(h_1 - h_2); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta ke = \Delta pe \cong 0)$$

$$\Rightarrow \dot{W}_{el} = \dot{m} \left[c(T_1 - T_2) + v \left(\cancel{p_1} - p_2 \right)^0 \right];$$

$$\Rightarrow \dot{W}_{el} = (1)(4.184)(25 - 100);$$

$$\Rightarrow \dot{W}_{el} = -313.8 \text{ kW} \therefore \dot{W}_{el,in} = \mathbf{313.8 \text{ kW}}$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study.

The TEST-code for this problem can be found in the TEST-Pro site

at www.thermofluids.net.

4-1-4 [JD] Water flows steadily down an insulated vertical pipe (of constant diameter). The following conditions are given at the inlet and exit. Inlet (state-1): $T_1 = 20^\circ\text{C}$, $V_1 = 10\text{ m/s}$, $z_1 = 10\text{ m}$; Exit (state-2): $T_2 = 20^\circ\text{C}$, $p_2 = 100\text{ kPa}$, $z_2 = 0\text{ m}$. Determine (a) the velocity at the exit (m/s), (b) the pressure at the inlet (in kPa). Use the SL model for water. Do not neglect ke and pe . **What-if Scenario:** What would be the answer in part c if the change in potential energy was neglected?

SOLUTION

Given:

$$c_p = c_v = c = 4.184 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

$$v_1 = v_2 = 0.001 \frac{\text{m}^3}{\text{kg}};$$

$$\rho_1 = \rho_2 = 997 \frac{\text{kg}}{\text{m}^3};$$

$$A_1 = A_2;$$

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given T_1, V_1, z_1)

State-2 (given $T_2, z_2, \dot{m}_2 = \dot{m}_1$)

(a) From the mass balance equation, we have

$$\frac{dm}{dt} = \sum \dot{m}_i - \sum \dot{m}_e;$$

$$\dot{m} = \rho AV;$$

$$\Rightarrow \rho_1 A_1 V_1 = \rho_2 A_2 V_2;$$

$$\Rightarrow \frac{\rho_1 A_1}{\rho_2 A_2} V_1 = V_2;$$

$$\Rightarrow V_1 = V_2 = 10 \frac{\text{m}}{\text{s}}$$

(b) From the energy balance equation, we have

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow 0 = \dot{m}(j_1 - j_2); \quad (\text{since } \dot{W}_{\text{ext}} = \dot{Q} \cong 0)$$

$$\Rightarrow 0 = \Delta h + \Delta ke + \Delta pe;$$

$$\Rightarrow 0 = c(T_1 - T_2) + v(p_1 - p_2) + \frac{V_1^2 - V_2^2}{2000} + g \frac{z_1 - z_2}{1000};$$

$$\Rightarrow p_1 = p_2 - \left[\frac{g}{v} \left(\frac{z_1 - z_2}{1000} \right) \right];$$

$$\Rightarrow p_1 = 100 - \left[\left(\frac{9.81}{0.001} \right) \left(\frac{10 - 0}{1000} \right) \right];$$

$$\Rightarrow p_1 = 1.9 \text{ kPa}$$

TEST Solution:

Launch the SL single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-5 [JQ] Water flows down steadily through a long 10-cm diameter vertical pipe. At the inlet: $p = 300 \text{ kPa}$, $T = 50^\circ\text{C}$, $V = 5 \text{ m/s}$, and $z = 125 \text{ m}$; At the exit: $p = 1250 \text{ kPa}$, $T = 20^\circ\text{C}$, and $z = 10 \text{ m}$. If the surrounding ambient temperature is 10°C , use SL model ($\rho = 997 \text{ kg/m}^3$, $c_v = 4.184 \text{ kJ/kg}\cdot\text{K}$) to determine the (a) velocity at the exit in m/s, (b) mass flow rate in kg/s, (c) the rate of heat transfer in kW, and (d) rate of entropy generation in the pipe's universe. (e) **What-if Scenario:** What would be the answer in part c if the change in potential energy was neglected?

SOLUTION

Given:

$$c_p = c_v = c = 4.184 \frac{\text{kJ}}{\text{kg}\cdot\text{K}};$$

$$v_1 = v_2 = 0.001 \frac{\text{m}^3}{\text{kg}};$$

$$\rho_1 = \rho_2 = 997 \frac{\text{kg}}{\text{m}^3};$$

$$A_1 = A_2;$$

$$D = 10 \text{ cm};$$

$$T_B = 10^\circ\text{C};$$

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, V_1, z_1)

State-2 (given $p_2, T_2, z_2, \dot{m}_2 = \dot{m}_1$)

© 2016 Pearson Education, Inc., Hoboken, NJ. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.

(a) From the mass balance equation, we have

$$\frac{dm}{dt} = \sum \dot{m}_i - \sum \dot{m}_e;$$

$$\dot{m} = \rho AV;$$

$$\Rightarrow \rho_1 A_1 V_1 = \rho_2 A_2 V_2;$$

$$\Rightarrow \frac{\rho_1 A_1}{\rho_2 A_2} V_1 = V_2;$$

$$\Rightarrow V_1 = V_2 = 5 \frac{\text{m}}{\text{s}}$$

(b) $\dot{m} = \rho AV;$

$$\Rightarrow \dot{m} = (997) \left(\pi \frac{0.1^2}{4} \right) (5);$$

$$\Rightarrow \dot{m} = 39.15 \frac{\text{kg}}{\text{s}}$$

(c) From the energy balance equation, we have

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{Q} = \dot{m}(j_2 - j_1); \quad (\text{since } \dot{W}_{\text{ext}} = 0)$$

$$\Rightarrow \dot{Q} = \dot{m}(\Delta h + \Delta ke + \Delta pe);$$

$$\Rightarrow \dot{Q} = \dot{m} \left[c(T_2 - T_1) + v(p_2 - p_1) + \frac{V_2^2 - V_1^2}{2000} + g \frac{z_2 - z_1}{1000} \right];$$

$$\Rightarrow \dot{Q} = (39.15) \left[(4.184)(20 - 50) + (0.001)(1250 - 300) + \frac{V_1^2 - V_2^2}{2000} + (9.81) \frac{10 - 125}{1000} \right];$$

$$\Rightarrow \dot{Q} = -4921.1 \text{ kW}$$

(d) From the entropy balance equation, we have

$$\frac{dS}{dt} = \dot{m}(s_1 - s_2) + \frac{\dot{Q}}{T_B} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1) - \frac{\dot{Q}}{T_B};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}c \ln \frac{T_2}{T_1} - \frac{\dot{Q}}{T_B};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = (39.15)(4.184) \ln \left(\frac{293}{323} \right) - \frac{-4921.1}{283};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 1.421 \frac{\text{kW}}{\text{K}}$$

TEST Solution and What-if Scenario:

Launch the SL single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-6 [JC] Water flows steadily into a well-insulated electrical water heater (see Anim. 4-1-1) with a mass flow rate of 1 kg/s at 100 kPa, 25°C. Determine (a) the rate of entropy generation in the water heater's universe if the water becomes saturated (liquid) at the exit. Assume no pressure loss, neglect changes in ke and pe , and use the SL model (use $c_v = 4.184 \text{ kJ/kg.K}$ for water). The ambient atmospheric conditions are 100 kPa and 20°C. (b) **What-if Scenario:** What would the entropy generation rate be if the PC model were used instead?

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, \dot{m}_1)

State-2 (given $p_2 = p_1, x_2, \dot{m}_2 = \dot{m}_1$):

$$T_2 = T_{\text{sat}@100\text{kPa}} = 100^\circ\text{C};$$

(a) The entropy equation, applied to the overall system produces:

$$\frac{dS^0}{dt} = \dot{m}(s_1 - s_2) + \frac{\dot{\Phi}^0}{T_B} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow 0 = \dot{m} \left(c_p \ln \frac{T_1}{T_2} \right) + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow 0 = \left[4.184 \ln \left(\frac{298}{373} \right) \right] + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow 0 = -0.939 + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 0.939 \frac{\text{kW}}{\text{K}}$$

TEST Solution and What-if Scenario:

Launch the SL single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. $$\begin{aligned}\frac{dE}{dt}^0 &= \dot{m}(j_1 - j_2) + \dot{Q}^0 - \dot{W}_{\text{ext}}; \\ \Rightarrow \dot{W}_{\text{el}} &= \dot{m}(h_1 - h_2); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta \text{ke} = \Delta \text{pe} \cong 0) \\ \Rightarrow \dot{W}_{\text{el}} &= 417.46 - 2675.5; \\ \Rightarrow \dot{W}_{\text{el}} &= -2258 \text{ kW} \therefore \dot{W}_{\text{el, in}} = \mathbf{2258 \text{ kW}}\end{aligned}$$

(b) From the entropy balance equation, we have

$$\begin{aligned}\frac{dS}{dt}^0 &= \dot{m}(s_1 - s_2) + \frac{\dot{Q}^0}{T_B} + \dot{S}_{\text{gen, univ}}; \\ \Rightarrow \dot{S}_{\text{gen, univ}} &= \dot{m}(s_2 - s_1); \\ \Rightarrow \dot{S}_{\text{gen, univ}} &= (7.3594 - 1.3026); \\ \Rightarrow \dot{S}_{\text{gen, univ}} &= \mathbf{6.0568 \frac{\text{kW}}{\text{K}}}\end{aligned}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-8 [JT] Saturated vapor of water flows steadily into a well-insulated electrical super heater with a mass flow rate of 1 kg/s at 100 kPa. Determine (a) the electrical power consumption, and (b) the rate of entropy generation in the water heater's universe if the vapor is superheated to 175°C at the exit. Assume no pressure loss, neglect changes in ke and pe, and use the PC model. The ambient atmospheric conditions are 100 kPa and 20°C.

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1 , x_1 , \dot{m}_1):

$$T_1 = T_{\text{sat}@100\text{kPa}} = 100^\circ\text{C};$$

$$h_1 = h_{g@100\text{kPa}} = 2675.5 \frac{\text{kJ}}{\text{kg}};$$

$$s_1 = s_{g@100\text{kPa}} = 7.3594 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given $p_2 = p_1$, T_2 , $\dot{m}_2 = \dot{m}_1$)

$$h_2 = 2825.8 \frac{\text{kJ}}{\text{kg}}; \quad s_2 = 7.7237 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

(a) From the energy balance equation, we have

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{\phi}^0 - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{W}_{el} = \dot{m}(h_1 - h_2); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta ke = \Delta pe \cong 0)$$

$$\Rightarrow \dot{W}_{el} = 2675.5 - 2825.8;$$

$$\Rightarrow \dot{W}_{el} = -150.3 \text{ kW} \therefore \dot{W}_{el,in} = \mathbf{150.3 \text{ kW}}$$

(b) From the entropy balance equation, we have

$$\frac{dS^0}{dt} = \dot{m}(s_1 - s_2) + \frac{\dot{\Phi}^0}{T_B} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = (7.7237 - 7.3594);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \mathbf{0.3643 \frac{\text{kW}}{\text{K}}}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-9 [JY] An insulated high-pressure electric water heater operates at steady state at a constant pressure of 10 MPa, supplying hot water at a mass flow rate of 10 kg/s. If the inlet temperature is 20°C and the exit temperature is 200°C, determine (a) the electrical power consumption, (b) the volume flow rate in L/min at the inlet, (c) the volume flow rate in L/min at the exit, and (d) the rate of entropy generation in the heater. Use the PC model for water, neglect any pressure drop in the heater, and also neglect any change in ke or pe .

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, \dot{m}_1):

$T_{\text{sat}@10\text{MPa}} = 311.06^\circ\text{C} \therefore$ subcooled liquid

$$h_1 = h_{f@20^\circ\text{C}} = 83.96 \frac{\text{kJ}}{\text{kg}};$$

$$s_1 = s_{f@20^\circ\text{C}} = 0.2966 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

$$v_1 = v_{f@20^\circ\text{C}} = 0.00100 \frac{\text{m}^3}{\text{kg}};$$

State-2 (given $p_2 = p_1, T_2, \dot{m}_2 = \dot{m}_1$):

$$T_{\text{sat}@10\text{MPa}} = 311.06^\circ\text{C} \therefore \text{subcooled liquid}$$

$$h_2 = h_{f@200^\circ\text{C}} = 852.45 \frac{\text{kJ}}{\text{kg}};$$

$$s_2 = s_{f@200^\circ\text{C}} = 2.3309 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

$$v_2 = v_{f@200^\circ\text{C}} = 0.00116 \frac{\text{m}^3}{\text{kg}};$$

(a) From the energy balance equation, we have

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{\mathcal{Q}}^0 - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{W}_{\text{ext}} = \dot{m}(h_1 - h_2); \quad (\text{since } \dot{\mathcal{Q}} \cong 0, \text{ and } \Delta\text{ke} = \Delta\text{pe} \cong 0)$$

$$\Rightarrow \dot{W}_{\text{ext}} = (10)(83.96 - 852.45);$$

$$\Rightarrow \dot{W}_{\text{ext}} = -7684.9 \text{ kW}$$

Therefore, the amount of power consumed is **7684.9 kW**.

(b) $\dot{\mathcal{V}} = \dot{m}v;$

$$\Rightarrow \dot{\mathcal{V}} = (\dot{m})(v)(60)(1000); \quad \left[\left(\frac{\text{kg}}{\text{s}} \right) \left(\frac{\text{m}^3}{\text{kg}} \right) \left(\frac{\text{L}}{\text{m}^3} \right) \left(\frac{\text{s}}{\text{min}} \right) = \frac{\text{L}}{\text{min}} \right]$$

$$\Rightarrow \dot{\mathcal{V}}_1 = (10)(0.00100)(60)(1000);$$

$$\Rightarrow \dot{\mathcal{V}}_1 = \mathbf{600 \frac{L}{min}}$$

(c) $\dot{\mathcal{V}} = \dot{m}v;$

$$\Rightarrow \dot{\mathcal{V}}_2 = (10)(0.00116)(60)(1000);$$

$$\Rightarrow \dot{\mathcal{V}}_2 = \mathbf{696 \frac{L}{min}}$$

(d) From the entropy balance equation, we have

$$\frac{dS^0}{dt} = \dot{m}(s_1 - s_2) + \frac{\dot{\mathcal{Q}}^0}{T_B} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = (10)(2.3309 - 0.2966);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \mathbf{20.343 \frac{kW}{K}}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-10 [JF] Water enters a boiler tube at 50 deg-C, 10 MPa at a rate of 10 kg/s. Heat is transferred from the hot surroundings in the boiler (created by combustion of coal) maintained at 1000 deg-C. Water exits the boiler as saturated vapor. Determine (a) the heating rate in MW, (b) the rate at which entropy is generated in the boiler tube's universe in kW/K. Assume steady state. Neglect any pressure drop in the boiler, and changes in ke and pe.

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, \dot{m}_1):

$$T_{\text{sat}@10\text{MPa}} = 311.06^\circ\text{C} \therefore \text{subcooled liquid}$$

$$h_1 = h_{f@50^\circ\text{C}} = 209.33 \frac{\text{kJ}}{\text{kg}};$$

$$s_1 = s_{f@50^\circ\text{C}} = 0.7038 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given $p_2 = p_1, x_2, \dot{m}_2 = \dot{m}_1$):

$$T_2 = T_{\text{sat}@10\text{MPa}} = 311.06^\circ\text{C};$$

$$h_2 = h_{g@10\text{MPa}} = 2724.7 \frac{\text{kJ}}{\text{kg}};$$

$$s_2 = s_{g@10\text{MPa}} = 5.6141 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

(a) From the energy balance equation, we have

$$\begin{aligned}\cancel{\frac{dE}{dt}}^0 &= \dot{m}(j_1 - j_2) + \dot{Q} - \cancel{\dot{W}_{\text{ext}}}^0; \\ \Rightarrow \dot{Q} &= \dot{m}(h_2 - h_1); \quad (\text{since } \dot{W}_{\text{ext}} = 0, \text{ and } \Delta \text{ke} = \Delta \text{pe} \cong 0) \\ \Rightarrow \dot{Q} &= (10)(2724.7 - 209.33); \\ \Rightarrow \dot{Q} &= 25153.7 \text{ kW} = \mathbf{25.1 \text{ MW}}\end{aligned}$$

(b) From the entropy balance equation, we have

$$\begin{aligned}\cancel{\frac{dS}{dt}}^0 &= \dot{m}(s_1 - s_2) + \frac{\dot{Q}}{T_B} + \dot{S}_{\text{gen,univ}}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= \dot{m}(s_2 - s_1) - \frac{\dot{Q}}{T_B}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= (10)(5.6141 - 0.7038) - \frac{25100}{1273}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= \mathbf{29.39 \frac{\text{kW}}{\text{K}}}\end{aligned}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-11 [JJ] A coal-fired boiler produces superheated steam steadily at 1 MPa, 500°C from the feed water which enters the boiler at 1 MPa, 50°C. For a flow rate of 10 kg/s, determine (a) the rate of heat transfer from the boiler to the water. (b) If the energetic efficiency of the boiler is 80% and the heating value of coal is 32.8 MJ/kg, determine the rate of fuel consumption in tons/hr. (c) **What-if scenario:** How would the answer in part (a) change if the boiler pressure was 3 MPa?

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1):

$$h_1 = 210.33 \frac{\text{kJ}}{\text{kg}}; \quad v_1 = 0.00101 \frac{\text{m}^3}{\text{kg}};$$

State-2 (given $p_2 = p_1, T_2$):

$$h_2 = 3478.42 \frac{\text{kJ}}{\text{kg}}; \quad v_2 = 0.35411 \frac{\text{m}^3}{\text{kg}};$$

(a) The energy balance for the steady flow system can be expressed as:

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{Q} = \dot{m}(h_2 - h_1); \quad (\text{Since } \dot{W}_{\text{ext}} = 0, \Delta \text{ke} = \Delta \text{pe} \cong 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow \dot{Q} = 10(3478.42 - 210.33);$$

$$\Rightarrow \dot{Q} = \mathbf{32.68 \text{ MW}}$$

(b) The rate of fuel consumption is:

$$\eta = \frac{\dot{Q}_{\text{out}}}{\dot{Q}_{\text{in}}} = 0.8;$$

$$\Rightarrow \dot{Q}_{\text{in}} = \frac{\dot{Q}_{\text{out}}}{0.8};$$

$$\Rightarrow \dot{Q}_{\text{in}} = \frac{32.68}{0.8};$$

$$\Rightarrow \dot{Q}_{\text{in}} = 40.85 \text{ MW};$$

$$\text{Given, heating value} = 32.8 \frac{\text{MJ}}{\text{kg}};$$

$$\dot{m}_F = \frac{\dot{Q}_{\text{in}}}{q_{\text{comb}}};$$

$$\Rightarrow \dot{m}_F = \frac{40.85}{32.8};$$

$$\Rightarrow \dot{m}_F = 1.245 \frac{\text{kg}}{\text{s}} = 4.482 \frac{\text{tons}}{\text{hr}}$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-12 [JM] Saturated steam at 40°C is to be cooled to saturated liquid in a condenser. If the mass flow rate of the steam is 20 kg/s, (a) determine the rate of heat transfer in MW. Assume no pressure loss. (b) **What-if Scenario:** What would the rate of heat transfer be if the steam were at 90°C?

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given T_1, x_1, \dot{m}_1):

$$p_{\text{sat}@40^\circ\text{C}} = 7.384 \text{ kPa};$$

$$h_1 = h_{g@40^\circ\text{C}} = 2574.3 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given $p_2 = p_1, x_2, \dot{m}_2 = \dot{m}_1$):

$$T_2 = T_{\text{sat}@p_2} = 40^\circ\text{C};$$

$$h_2 = h_{f@40^\circ\text{C}} = 167.57 \frac{\text{kJ}}{\text{kg}};$$

(a) From the energy balance equation, we have

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{Q} = \dot{m}(h_2 - h_1); \quad (\text{since } \dot{W}_{\text{ext}} = 0, \text{ and } \Delta \text{ke} = \Delta \text{pe} \cong 0)$$

$$\Rightarrow \dot{Q} = (20)(167.57 - 2574.3);$$

$$\Rightarrow \dot{Q} = -48134.6 \text{ kW} = -48.1 \text{ MW}$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-13 [WO] Water enters a boiler with a flow rate of 1 kg/s at 100 kPa, 20oC and leaves as saturated vapor. Assuming no pressure loss and neglecting changes in ke and pe, determine (a) the rate of heat transfer in kW. (b) If the heating value of gasoline is 44 MJ/kg, what is the consumption rate of gasoline in kg/s? Use PC model for H2O. **What-if Scenario:** What would the fuel consumption rate if the water were preheated by solar radiation to 90oC?

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, \dot{m}_1):

$$h_1 = 84.06 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given $p_2 = p_1, x_2, \dot{m}_2 = \dot{m}_1$):

$$h_2 = 2675.4 \frac{\text{kJ}}{\text{kg}};$$

(a) The energy balance for the steady flow system can be expressed as,

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{m}(h_2 - h_1) = \dot{Q} - \cancel{\dot{W}_{\text{ext}}^0}; \quad (\text{Since } \Delta ke = \Delta pe \cong 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow \dot{Q} = (1)(2675.4 - 84.06);$$

$$\Rightarrow \dot{Q} = \mathbf{2591.34 \text{ kW}}$$

(b) Given, heating value = $44 \frac{\text{MJ}}{\text{kg}}$;

$$\dot{m}_F = \frac{\dot{Q}_{\text{in}}}{q_{\text{comb}}};$$

$$\Rightarrow \dot{m}_F = \frac{2591}{44000};$$

$$\Rightarrow \dot{m}_F = 0.06 \frac{\text{kg}}{\text{s}}$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. 4-1-14 [JW] Air at a pressure of 150 kPa, a velocity of 0.2 m/s, and a temperature of 30°C flows steadily in a 10 cm-diameter duct. After a transition, the duct is exhausted uniformly through a rectangular slot 3 cm x 6 cm in cross section. (a) Determine the exit velocity. Assume incompressible flow and use the PG model for air. (b) *What-if scenario:* Would the answer be affected if the IG model was used?

SOLUTION

Steady state process with one inlet and one exit.

$$v_1 = \frac{RT_1}{P_1}; \quad \Rightarrow v_1 = \frac{(0.287)(303)}{150}; \quad \Rightarrow v_1 = 0.58 \frac{\text{m}^3}{\text{kg}}$$

$$A_1 = \frac{\pi D^2}{4}; \quad \Rightarrow A_1 = \frac{\pi(0.1)^2}{4};$$

$$\Rightarrow A_1 = 0.00785 \text{ m}^2;$$

$$A_2 = l \times b; \quad \Rightarrow A_2 = (0.03)(0.06);$$

$$\Rightarrow A_2 = 0.0018 \text{ m}^2;$$

$$\dot{m} = \frac{A_1 V_1}{v_1}; \quad \Rightarrow \dot{m} = \frac{(0.00785)(0.2)}{0.58}; \quad \Rightarrow \dot{m} = 0.0027 \frac{\text{kg}}{\text{s}};$$

$$(a) V_2 = \frac{\dot{m} v_2}{A_2}; \quad \Rightarrow V_2 = \frac{(0.0027)(0.58)}{0.0018}; \quad \Rightarrow V_2 = 0.87 \frac{\text{m}}{\text{s}}$$

TEST Solution and What-if Scenario:

Launch the IG single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-15 [WR] Air is heated in a duct as it flows over resistance wires. Consider a 20 kW electric heating system. Air enters the heating section at 100 kPa and 15°C with a volume flow rate of 140 m³/min. If heat is lost from air in the duct to the surroundings at a rate of 150 W, determine (a) the exit temperature of air, and (b) the energetic efficiency. Use the PG model for air and neglect the power consumed by the fan. (c) Draw an energy flow diagram for the system.

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, \dot{V}_1, A_1):

$$\dot{m}_1 = \rho A_1 \dot{V}_1; \quad \Rightarrow \dot{m}_1 = \rho \dot{V}_1; \quad \Rightarrow \dot{m}_1 = (1.21)(2.33); \quad \Rightarrow \dot{m}_1 = 2.82 \frac{\text{kg}}{\text{s}};$$

State-2 (given $\dot{m}_2 = \dot{m}_1$)

(a) The energy balance for the steady flow system can be expressed as,

$$\begin{aligned} \frac{dE}{dt} &= \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}}; \\ \Rightarrow \dot{m}(h_2 - h_1) &= \dot{m}c_p(T_2 - T_1) = \dot{Q} - \dot{W}_{\text{ext}}; \quad (\text{Since } \Delta \text{ke} = \Delta \text{pe} \cong 0 \text{ and } \dot{m}_1 = \dot{m}_2) \\ \Rightarrow (2.82)(1.003)(T_2 - T_1) &= .150 - (-20); \\ \Rightarrow T_2 &= \frac{20.15}{2.83} + 288 = 295.12 \text{ K}; \\ \Rightarrow T_2 &= 22.12^\circ\text{C} \end{aligned}$$

(b) The energetic efficiency

$$\eta_1 = \frac{\dot{m}(j_2 - j_1)}{-\dot{W}_{\text{ext}}}; \quad \Rightarrow \eta_1 = \frac{\dot{Q} + \dot{W}_{\text{ext}}}{-\dot{W}_{\text{ext}}}; \quad \Rightarrow \eta_1 = \frac{(0.15) + (-20)}{-(20)};$$

$$\Rightarrow \eta_1 = \frac{19.85}{20}; \quad \Rightarrow \eta_1 = 99.25 \%$$

(c) Energy flow diagram

TEST Solution:

Launch the PG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-16 [WB] Air flows steadily through a long insulated duct with a cross-sectional area of 100 cm². At the inlet, the conditions are 300 kPa, 300 K, and 10 m/s. At the exit, the pressure drops to 100 kPa due to frictional losses in the duct. Determine (a) the exit temperature and (b) the exit velocity. Use the PG model for air. (c) Explain why the temperature does not increase despite the presence of friction. (d) **What-if scenario:** Would the answers change significantly if the IG model was used for air? Why?

SOLUTION

The specific heat ratio of air $k = 1.4$. The constant pressure specific heat of air is

$$c_p = 1.00349 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1)

State-2 (given p_2)

(a) The energy equation, for the system can be simplified as follows.

$$\begin{aligned} \frac{dE}{dt} &= \dot{m}(h_1 - h_2) + \dot{Q} - \dot{W}_{\text{ext}}; \\ \Rightarrow h_1 - h_2 &= c_p(T_1 - T_2) = 0; \\ \Rightarrow T_2 &= T_1 = 300 \text{ K} \end{aligned}$$

(b) The mass flow equation, $\dot{m}_i = \dot{m}_e = \dot{m}$;

© 2016 Pearson Education, Inc., Hoboken, NJ. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.

$$\dot{m} = \frac{A_1 V_1}{v_1}; \quad \Rightarrow \dot{m} = \frac{A_1 V_1 p_1}{RT_1}; \quad \Rightarrow \dot{m} = \frac{(100 \times 10^{-4})(10)(300)}{(0.28699)(300)};$$

$$\Rightarrow \dot{m} = 0.34844 \frac{\text{kg}}{\text{s}};$$

$$V_2 = \frac{\dot{m} v_2}{A_2}; \quad \Rightarrow V_2 = \frac{\dot{m} R T_2}{A_2 p_2}; \quad \Rightarrow V_2 = \frac{(0.34844)(0.28699)(300)}{(100 \times 10^{-4})(100)};$$

$$\Rightarrow V_2 = 29.96 \frac{\text{m}}{\text{s}}$$

TEST Solution:

Launch the PG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-17 [WS] Air flows steadily through a long insulated duct with a constant cross-sectional area of 100 cm². At the inlet, the conditions are 300 kPa, 300 K and 10 m/s. At the exit, the pressure drops to 50 kPa due to frictional losses in the duct. Determine (a) the mass flow rate of air, (b) the exit temperature in K, and (c) the exit velocity in m/s. Use the PG model for air. (d) Determine the entropy generated due to thermodynamic friction in the duct.

SOLUTION

The specific heat ratio of air $k=1.4$. The constant pressure specific heat of air is

$$c_p = 1.00349 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, A_1)

State-2 (given p_2)

$$(a) \quad \dot{m} = \frac{A_1 V_1}{v_1}; \quad \Rightarrow \dot{m} = \frac{A_1 V_1 p_1}{RT_1}; \quad \Rightarrow \dot{m} = \frac{(0.01)(10)(300)}{(0.28699)(300)}; \quad \Rightarrow \dot{m} = 0.348 \frac{\text{kg}}{\text{s}}$$

(b) The energy equation, for the system can be simplified as follows.

$$\frac{dE}{dt} = \dot{m}(h_1 - h_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow h_1 - h_2 = c_p (T_1 - T_2) = 0;$$

$$\Rightarrow T_2 = T_1 = \textcolor{red}{300 \text{ K}}$$

(c) The mass flow equation, $\dot{m}_i = \dot{m}_e = \dot{m}$;

$$V_2 = \frac{\dot{m} v_2}{A_2}; \quad \Rightarrow V_2 = \frac{\dot{m} R T_2}{A_2 p_2}; \quad \Rightarrow V_2 = \frac{(0.34844)(0.28699)(300)}{(100 \times 10^{-4})(50)};$$

$$\Rightarrow V_2 = \textcolor{red}{59.92} \frac{\text{m}}{\text{s}}$$

(d) The entropy equation, applied to the overall system produces

$$\frac{dS'}{dt} = \dot{m}_1 s_1 - \dot{m}_2 s_2 + \frac{\dot{Q}}{T_B} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1) + \frac{\dot{\phi}^0}{T_B};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = (0.348)(7.086 - 6.577);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \textcolor{red}{0.1771} \frac{\text{kW}}{\text{K}}$$

TEST Solution:

Launch the PG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-18 [BET] Helium flows steadily through a long insulated duct with a constant cross-sectional area of 100 cm^2 . At the inlet, the conditions are 300 kPa, 300 K and 10 m/s. A 5 kW internal electrical heater is used to raise the temperature of the gas. At the exit, the pressure drops to 100 kPa due to frictional losses in the duct. Determine (a) the exit velocity (V_2), and (b) the rate of entropy generation (S_{gen}) in the system's universe. Use the PG model. (c) **What-if Scenario:** How would the answer in part (b) change if the heater were turned off? (assume the exit pressure to be 100 kPa).

SOLUTION

(a) State-1 (given p_1, T_1, A_1, V_1):

$$\rho_1 = \frac{p}{RT} = \frac{300}{(2.0785)(300)} = 0.4811 \frac{\text{kg}}{\text{m}^3};$$

$$\dot{m} = \rho AV = (0.4811)(0.01)(10) = 0.04811 \frac{\text{kg}}{\text{s}};$$

State-2 (given $p_2, A_2 = A_1, \dot{m}_2 = \dot{m}_1$)

From the mass balance equation

$$\dot{m}_2 = \dot{m}_1$$

$$\Rightarrow \rho_1 A_1 V_1 = \rho_2 A_2 V_2$$

$$\Rightarrow \left(\frac{p_1}{RT_1} \right) V_1 = \left(\frac{p_2}{RT_2} \right) V_2$$

$$\Rightarrow T_2 = T_1 \left(\frac{p_2}{p_1} \right) \left(\frac{V_2}{V_1} \right) = (300) \left(\frac{100}{300} \right) \left(\frac{V_2}{10} \right) = 10V_2$$

From the energy balance equation

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{\Phi}^0 - \dot{W}_{\text{ext}};$$

$$\Rightarrow 0 = \dot{m} \left(h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000} \right) - \dot{W}_{\text{ext}};$$

$$\Rightarrow V_2^2 = V_1^2 - 2000 \left(\frac{\dot{W}_{\text{ext}}}{\dot{m}} + h_2 - h_1 \right) = 10^2 - 2000 \left(\frac{-5}{0.04811} + 5.197(T_2 - T_1) \right);$$

Substituting the expression for T_2

$$V_2^2 = 10^2 - 2000(-103.93 + 5.197(10V_2 - 300));$$

Solving the quadratic equation we obtain:

$$V_2 = 31.99 \text{ m/s}$$

(b) The entropy equation produces

$$\frac{dS^0}{dt} = \dot{m}_1 s_1 - \dot{m}_2 s_2 + \frac{\dot{\Phi}^0}{T_B} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1) = \dot{m} \left(c_p \ln \frac{T_2}{T_1} - R \ln \frac{p_2}{p_1} \right);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 0.1259 \frac{\text{kW}}{\text{K}}$$

(c) If the heater is turned off, the entropy equation produces

$$\frac{dS^0}{dt} = \dot{m}_1 s_1 - \dot{m}_2 s_2 + \frac{\dot{\Phi}^0}{T_B} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1) = \dot{m} \left(c_p \ln \frac{T_2}{T_1} - R \ln \frac{p_2}{p_1} \right);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 0.1098 \frac{\text{kW}}{\text{K}}$$

TEST Solution and What-if Scenario:

Launch the PG single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-19 [WH] Steam enters a long, horizontal pipe with an inlet diameter of 14 cm at 1 MPa, 250°C with a velocity of 1.2 m/s. Further downstream, the conditions are 800 kPa and 210°C, and the diameter is 12 cm. Determine (a) the rate of heat transfer to the surroundings, which is at 25°C, and (b) the rate of entropy generation in the system's universe. (c) Draw an entropy flow diagram for the system.

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1 , T_1 , V_1 and A_1):

$$v_1 = 0.23267 \frac{\text{m}^3}{\text{kg}}; \quad h_1 = 2942.57 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 6.92 \frac{\text{kJ}}{\text{kg}};$$

$$\dot{m}_1 = \frac{A_1 V_1}{v_1}; \quad \Rightarrow \dot{m}_1 = \frac{(0.01538)(1.2)}{0.23267}; \quad \Rightarrow \dot{m}_1 = 0.0793 \frac{\text{m}}{\text{s}};$$

State-2 (given p_2 , T_2 , and $\dot{m}_1 = \dot{m}_2$):

$$v_2 = 0.26726 \frac{\text{m}^3}{\text{kg}}; \quad h_2 = 2861.37 \frac{\text{kJ}}{\text{kg}}; \quad s_2 = 6.86 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

$$V_2 = \frac{\dot{m}_2 v_2}{A_2}; \quad \Rightarrow V_2 = \frac{(0.0793)(0.26726)}{0.0113}; \quad \Rightarrow V_2 = 1.875 \frac{\text{m}}{\text{s}};$$

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}}^0;$$

© 2016 Pearson Education, Inc., Hoboken, NJ. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.

$$\Rightarrow \dot{Q} = \dot{m}(j_2 - j_1); \quad (\text{Since } \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow \dot{Q} = \dot{m}(h_2 + ke_2 - h_1 - ke_1);$$

$$\Rightarrow \dot{Q} = \dot{m} \left(h_2 - h_1 + \frac{V_2^2 - V_1^2}{2000} \right);$$

$$\Rightarrow \dot{Q} = 0.0793 \left(2861.37 - 2942.57 + \frac{1.875^2 - 1.2^2}{2000} \right);$$

$$\Rightarrow \dot{Q} = -6.44 \text{ kW}$$

(b) The entropy equation, applied to the overall system produces

$$\frac{dS^0}{dt} = \dot{m}_1 s_1 - \dot{m}_2 s_2 + \frac{\dot{Q}}{T_B} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1) + \frac{\dot{Q}}{T_B};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = (0.0793)(6.86 - 6.92) + \frac{6.44}{298};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 0.0168 \frac{\text{kW}}{\text{K}}$$

(c)

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-20 [WA] Refrigerant R-134a flows through a long, insulated pipe of constant cross-sectional area. At the inlet, the state is 200 kPa, 50°C. At another section further downstream, the state is 150 kPa, 34.3°C. Determine the velocity of the refrigerant at the inlet.

SOLUTION

Given:

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1):

$T_{\text{sat}@200\text{kPa}} = -10.22^\circ\text{C} \therefore$ superheated vapor

$$v_1 = 0.1275 \frac{\text{m}^3}{\text{kg}}; \quad h_1 = 295.12 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given $p_2, A_1 = A_2, \dot{m}_2 = \dot{m}_1$):

$T_{\text{sat}@150\text{kPa}} = -17.30^\circ\text{C} \therefore$ superheated vapor

$$v_2 = 0.1626 \frac{\text{m}^3}{\text{kg}}; \quad h_2 = 282.499 \frac{\text{kJ}}{\text{kg}};$$

From the mass balance equation, we have

$$\rho_1 A_1 V_1 = \rho_2 A_2 V_2;$$

$$\Rightarrow V_2 = \frac{\rho_1}{\rho_2} V_1 = \frac{v_2}{v_1} V_1 = \left(\frac{v_2}{0.1275} \right) (200) = 1568.6 v_2;$$

From the energy balance equation, we have

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow 0 = j_1 - j_2;$$

$$\Rightarrow 0 = h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000};$$

$$\Rightarrow 0 = 295.12 - h_2 + \frac{200^2 - 1568.6^2 v_2^2}{2000};$$

$$\Rightarrow h_2 + 1.2303 \times 10^3 v_2^2 - 315.12 = 0;$$

By guessing the temperature T_2 , the unknown properties h_2 and v_2 can be evaluated. The equation is satisfied when a few iteration yields:

$$T_2 = 34.3^\circ \text{C}; v_2 = 0.1626 \frac{\text{m}}{\text{s}};$$

$$\Rightarrow V_2 = 254.5 \frac{\text{m}}{\text{s}}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-21 [WI] An electric water heater supplies hot water at 200 kPa, 80°C at a flow rate of 8 L/min while consuming 32 kW of electrical power as shown in the accompanying animation. The water temperature at the inlet is 25°C, same as the temperature of the surroundings. Using the SL (solid/liquid) model for water and neglecting kinetic and potential energy changes, determine (a) the rate of heat loss to the atmosphere, (b) the energetic efficiency, and (c) the rate of entropy generation in the heater's universe. Assume no pressure loss in the system.

SOLUTION

Use the steady state SL model for water, with one inlet and one exit.

The specific heat $c = 4.184 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}$;

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, \dot{V}_1):

$$v_1 = 0.0010 \frac{\text{m}^3}{\text{kg}};$$

$$\dot{m}_1 = \frac{\dot{V}_1}{v_1}; \quad \Rightarrow \dot{m}_1 = \frac{(1.33 \times 10^{-4})}{0.0010}; \quad \Rightarrow \dot{m}_1 = 0.133 \frac{\text{kg}}{\text{s}};$$

State-2 (given $p_2 = p_1, T_2, \dot{m}_2 = \dot{m}_1$):

$$v_2 = 0.0010 \frac{\text{m}^3}{\text{kg}};$$

(a) The energy balance for the steady flow system can be expressed as

$$\begin{aligned}\frac{dE}{dt} &= \dot{m}(u_1 - u_2) + \dot{Q} - \dot{W}_{\text{ext}}; \\ \Rightarrow \dot{Q} &= \dot{m}c(T_2 - T_1) - \dot{W}_{\text{ext}}; \quad (\text{Since } \dot{m}_1 = \dot{m}_2) \\ \Rightarrow \dot{Q} &= (0.133)(4.184)(353 - 298) - 32; \\ \Rightarrow \dot{Q} &= -1.4 \text{ kW} \therefore \dot{Q}_{\text{loss}} = 1.4 \text{ kW}\end{aligned}$$

(b) The energetic efficiency

$$\begin{aligned}\eta_1 &= \frac{\dot{Q} + \dot{W}_{\text{ext}}}{-\dot{W}_{\text{ext}}}; \\ \Rightarrow \eta_1 &= \frac{(-1.4) - (-32)}{-(-32)}; \\ \Rightarrow \eta_1 &= \frac{30.6}{32}; \\ \Rightarrow \eta_1 &= 95.6 \%\end{aligned}$$

(c) The entropy equation, applied to the overall system produces

$$\begin{aligned}\frac{dS}{dt} &= \dot{m}_1 s_1 - \dot{m}_2 s_2 + \frac{\dot{Q}}{T_B} + \dot{S}_{\text{gen,univ}}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= \dot{m}(s_2 - s_1) + \frac{\dot{Q}}{T_B}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= \dot{m}c \ln \frac{T_2}{T_1} + \frac{\dot{Q}}{T_B}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= (0.133)(4.184) \ln \frac{353}{298} + \frac{1.4}{298}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= 0.0989 \frac{\text{ kW}}{\text{ K}}\end{aligned}$$

TEST Solution:

Launch the SL single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-22 [WN] Long steel rods of 5 cm diameter are heat-treated by drawing them at a velocity of 5 m/s through an oven maintained at a constant temperature of 1000°C. The rods enter the oven at 25°C and leave at 800°C. Determine (a) the rate of heat transfer to the rods from the oven and (b) the rate of entropy generation in the system's universe.

Use the SL model and assume steel to have the same material properties as iron. (c)

What-if scenario: How would the answer in part (b) change if the oven was maintained at 800°C?

SOLUTION

Use the steady state SL model for iron, with one inlet and one exit.

The specific heat $c = 0.45 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}$;

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, V_1):

$$A_1 = \frac{\pi(0.005)^2}{4}; \quad \Rightarrow A_1 = 0.00196 \text{ m}^2;$$

$$\rho_1 = 7840.0 \frac{\text{kg}}{\text{m}^3};$$

$$\dot{m}_1 = \rho_1 A_1 V_1; \quad \Rightarrow \dot{m}_1 = (7840)(0.00196)(5); \quad \Rightarrow \dot{m}_1 = 76.97 \frac{\text{kg}}{\text{s}};$$

State-2 (given $p_2 = p_1, T_2, \dot{m}_1 = \dot{m}_2$):

$$\rho_1 = 7840.0 \frac{\text{kg}}{\text{m}^3};$$

(a) The energy balance for the steady flow system can be expressed as

$$\begin{aligned} \frac{dE}{dt} &= \dot{m}(u_1 - u_2) + \dot{Q} - \dot{W}_{\text{ext}}; \\ \Rightarrow \dot{Q} &= \dot{m}c(T_2 - T_1); \quad (\text{Since } \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2) \\ \Rightarrow \dot{Q} &= (76.97)(0.45)(1073 - 298); \\ \Rightarrow \dot{Q} &= \mathbf{26.843 \text{ MW}} \end{aligned}$$

(b) The entropy equation, applied to the overall system produces

$$\begin{aligned} \frac{dS}{dt} &= \dot{m}_1 s_1 - \dot{m}_2 s_2 + \frac{\dot{Q}}{T_B} + \dot{S}_{\text{gen,univ}}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= \dot{m}(s_2 - s_1) - \frac{\dot{Q}}{T_B}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= \dot{m}c \ln \frac{T_2}{T_1} - \frac{\dot{Q}}{T_B}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= (76.97)(0.45) \ln \frac{1073}{298} - \frac{26843}{1273}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= \mathbf{23.3 \frac{\text{kW}}{\text{K}}} \end{aligned}$$

TEST Solution and What-if Scenario:

Launch the SL single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-23 [WE] Liquid water flows steadily through an insulated nozzle. The following data are supplied. Inlet: $p = 500 \text{ kPa}$, $T = 25^\circ\text{C}$, $V = 10 \text{ m/s}$; Exit: $p = 100 \text{ kPa}$, $T = 25^\circ\text{C}$. Determine the exit velocity by using (a) the SL model and (b) the PC model for water. (c) **What-if scenario:** How would the exit velocity be affected if the exit area was reduced without changing other inlet or exit conditions?

SOLUTION

Use the SL model for water, with one inlet and one exit.

The specific heat $c = 4.184 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}$;

Let state-1 represents the inlet state and state-2 the exit state.

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow j_1 = j_2; \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow h_1 + ke_1 = h_2 + ke_2;$$

$$\Rightarrow h_1 - h_2 = \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow c(T_1 - T_2)^0 + v(p_1 - p_2) = \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow V_2 = \sqrt{(2000v(p_1 - p_2) + V_1^2)};$$

$$\Rightarrow V_2 = \sqrt{((2000)(0.0010)(500 - 100) + 10^2)};$$

$$\Rightarrow V_2 = 30 \frac{\text{m}}{\text{s}}$$

Using the steady state PC model for water, with one inlet and one exit

State-1 (given p_1 , T_1 , V_1):

$$h_1 = 105.38 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given p_2 , T_2 , $\dot{m}_2 = \dot{m}_1$):

$$h_2 = 104.97 \frac{\text{kJ}}{\text{kg}};$$

(b) The energy balance for the steady flow system can be expressed as

$$\frac{dE}{dt}^0 = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}}$$

$$\Rightarrow j_1 = j_2; \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow h_1 + ke_1 = h_2 + ke_2;$$

$$\Rightarrow h_1 - h_2 = \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow 105.38 - 104.97 = \frac{V_2^2 - 10^2}{2000};$$

$$\Rightarrow V_2 = \sqrt{(2000(105.38 - 104.97) + 10^2)};$$

$$\Rightarrow V_2 = 30.33 \frac{\text{m}}{\text{s}}$$

TEST Solution and What-if Scenario:

Launch the SL single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-24 [WL] A water tower in a chemical plant holds 2000 L of liquid water at 25°C, 100 kPa in a tank on top of a 10-m-tall tower. A pipe leads to the ground level with a tap that can open a 1 cm-diameter hole. Neglect friction and pipe losses and estimate the time it will take to empty the tank. Use the SL model for water.

SOLUTION

Use the steady state SL model for water, with one inlet and one exit.

Let state-1 represent the inlet and state-2 the exit state.

$$m = \rho V; \quad \Rightarrow m = (997)(2); \quad \Rightarrow m = 1994 \text{ kg};$$

The energy balance for the steady flow system can be expressed as

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow j_1 = j_2; \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow h_1 + ke_1 + pe_1 = h_2 + ke_2 + pe_2;$$

$$\Rightarrow \frac{g(z_1 - z_2)}{1000} = \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow V_2^2 = 2(9.81)(10); \quad (\text{Since } V_1 = 0)$$

$$\Rightarrow V_2 = 14 \frac{\text{m}}{\text{s}};$$

Then we can use the mass flow rate to determine the time:

© 2016 Pearson Education, Inc., Hoboken, NJ. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.

$$\dot{m} = \frac{m}{t}; \quad \Rightarrow \dot{m} = \rho A_2 V_2;$$

$$\Rightarrow t = \frac{m}{\rho A_2 V_2};$$

$$\Rightarrow t = \frac{1994}{(997)(7.85 \times 10^{-5})(14)};$$

$$\Rightarrow t = 1819 \text{ s} = \mathbf{30.3 \text{ min}}$$

TEST Solution:

Launch the SL single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-25 [WG] A large supply line carries water at a pressure of 1 MPa. A small leak with an area of 1 cm² develops on the pipe which is exposed to the atmosphere at 100 kPa. Assuming the resulting flow to be isentropic, determine (a) the velocity of the jet and (b) the leakage rate in kg/min. (c) **What-if scenario:** How would the answers change as the leakage area increased to 2 cm²?

SOLUTION

Use the steady state SL model for water, with one inlet and one exit.

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1 , T_1 , \dot{m}_1)

State-2 (given p_2 , T_2 , $s_2 = s_1$, $\dot{m}_2 = \dot{m}_1$)

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow j_1 = j_2; \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow h_1 + ke_1 = h_2 + ke_2;$$

$$\Rightarrow h_1 - h_2 = \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow c(T_1 - T_2)^0 + v(p_1 - p_2) = \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow V_2 = \sqrt{(2000v(p_1 - p_2))};$$

$$\Rightarrow V_2 = \sqrt{((2000)(0.0010)(1000 - 100))};$$

$$\Rightarrow V_2 = 42.4 \frac{\text{m}}{\text{s}}$$

(b) The mass flow rate is

$$\dot{m} = \rho AV; \quad \Rightarrow \dot{m} = \frac{AV}{v}; \quad \Rightarrow \dot{m} = \frac{(0.0001)(42.4)}{0.001}; \quad \Rightarrow \dot{m} = 4.24 \frac{\text{kg}}{\text{s}};$$

$$\Rightarrow \dot{m} = 254.4 \frac{\text{kg}}{\text{min}}$$

TEST Solution and What-if Scenario:

Launch the SL single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-26 [WZ] Steam enters a nozzle operating steadily at 5 MPa, 350°C, 10 m/s and exits at 2 MPa, 267°C. The steam flows through the nozzle with negligible heat transfer and PE. The mass flow rate (\dot{m}) is 2 kg/s. Determine (a) the exit velocity (V_2) and (b) the exit area. (c) Draw an energy flow diagram for the nozzle.

SOLUTION

Use TEST or the manual approach to determine the anchor states – state-1 for the inlet, state-2 for the actual exit.

State-1 (given p_1, T_1, V_1, \dot{m}):

$$v_1 = 0.0519 \frac{\text{m}^3}{\text{kg}}; \quad h_1 = 3068.4 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 6.449 \frac{\text{kJ}}{\text{kg}}$$

State-2 (given p_2, T_2, \dot{m}):

$$v_2 = 0.1162 \frac{\text{m}^3}{\text{kg}}; \quad h_2 = 2943.6 \frac{\text{kJ}}{\text{kg}};$$

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow j_1 = j_2; \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow h_1 + ke_1 = h_2 + ke_2;$$

$$\Rightarrow h_1 - h_2 = \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow V_2 = \sqrt{(2000(h_1 - h_2) + V_1^2)};$$

$$\Rightarrow V_2 = \sqrt{(2000(3068.5 - 2943.6) + 100)};$$

$$\Rightarrow V_2 = 499.9 \frac{\text{m}}{\text{s}}$$

$$(b) A_2 = \frac{\dot{m}v_2}{V_2}; \quad \Rightarrow A_2 = \frac{(2)(0.1162)}{499.9};$$

$$\Rightarrow A_2 = 4.65 \times 10^{-4} \text{ m}^2 = 4.65 \text{ cm}^2$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-27 [WK] Steam enters an adiabatic nozzle steadily at 3 MPa, 670 K, 50 m/s, and exits at 2 MPa and 200 m/s. If the nozzle has an inlet area of 7 cm². Determine (a) the exit area. (b) *What-if scenario:* How would the conclusion change if the exit velocity was 400 m/s?

SOLUTION

Use TEST or the manual approach to determine the anchor states – state-1 for the inlet, state-2 for the actual exit.

State-1 (given p_1, T_1, V_1, A_1):

$$v_1 = 0.0988 \frac{\text{m}^3}{\text{kg}}; \quad h_1 = 3223.515 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 6.909 \frac{\text{kJ}}{\text{kg}};$$

$$\dot{m} = \frac{A_1 V_1}{v_1}; \quad \Rightarrow \dot{m} = \frac{(0.0007)(50)}{0.0988}; \quad \Rightarrow \dot{m} = 0.354 \frac{\text{kg}}{\text{s}};$$

State-2 (given p_2, V_2, \dot{m})

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow j_1 = j_2; \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow h_1 + \text{ke}_1 = h_2 + \text{ke}_2;$$

$$\Rightarrow h_1 - h_2 = \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow h_2 = h_1 - \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow h_2 = 3223.515 - \left(\frac{200^2 - 50^2}{2000} \right);$$

$$\Rightarrow h_2 = 3204.77 \frac{\text{kJ}}{\text{kg}}; \quad \therefore v_2 = 0.14631 \frac{\text{m}^3}{\text{kg}};$$

The exit area of the nozzle

$$A_2 = \frac{\dot{m} v_2}{V_2}; \quad \Rightarrow A_2 = \frac{(0.354)(0.14631)}{200}; \quad \Rightarrow A_2 = 2.59 \text{ cm}^2$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study.

The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-28 [WP] Superheated steam is stored in a large tank at 5 MPa and 800°C. The steam is exhausted isentropically through a converging-diverging nozzle. Determine (a) the exit pressure, and (b) the exit velocity for the condensation to begin at the exit. Use the PC model for steam. (c) *What-if scenario:* How would the answer in part (b) change if steam was treated as a perfect gas?

SOLUTION

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1 , T_1 , x_1):

$$h_1 = 4137.1 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 7.7440 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given $s_2 = s_1$, x_2):

$$T_2 = 70.77^\circ \text{C}; \quad h_2 = 2628.1 \frac{\text{kJ}}{\text{kg}};$$

(a) $p_2 = 32.2 \text{ kPa}$

(b) The energy balance for the steady flow system can be expressed as

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow j_1 = j_2; \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow h_1 + ke_1 = h_2 + ke_2;$$

$$\Rightarrow h_1 - h_2 = \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow V_2 = \sqrt{\left(2000(h_1 - h_2) + V_1^2\right)};$$

$$\Rightarrow V_2 = \sqrt{\left(2000(4137.1 - 2628.1)\right)};$$

$$\Rightarrow V_2 = 1737.24 \frac{\text{m}}{\text{s}}$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study.

The TEST-code for this problem can be found in the TEST-Pro site

at www.thermofluids.net.

4-1-29 [WU] Steam enters a nozzle operating at steady state at 5 MPa and 420°C with negligible velocity, and exits at 3 MPa and 466 m/s. If the mass flow rate is 3 kg/s. Determine (a) the exit area, (b) the exit temperature, and (c) the rate of entropy generation in the nozzle. Neglect heat transfer and PE.

SOLUTION

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1, T_1, \dot{m}_1):

$$h_1 = 3243.81 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 6.714 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given $p_2, V_2, \dot{m}_2 = \dot{m}_1$)

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow j_1 = j_2; \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow h_1 + ke_1 = h_2 + ke_2;$$

$$\Rightarrow h_1 - h_2 = \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow h_2 = h_1 - \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow h_2 = 3243.81 - \frac{(466)^2}{2000};$$

$$\Rightarrow h_2 = 3135.23 \frac{\text{kJ}}{\text{kg}};$$

$$\therefore v_2 = 0.09204 \frac{\text{m}^3}{\text{kg}} \text{ and } s_2 = 6.773 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

$$A_2 = \frac{\dot{m} v_2}{V_2}; \quad \Rightarrow A_2 = 5.9 \text{ cm}^2$$

(b) $T_2 = 358.55 \text{ }^\circ\text{C}$

(c) The entropy equation, applied to the overall adiabatic system produces

$$\frac{dS}{dt} = \dot{m}_1 s_1 - \dot{m}_2 s_2 + \frac{\dot{Q}}{T_B} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = (3)(6.773 - 6.714);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 0.177 \frac{\text{kW}}{\text{K}}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-30 [WX] An adiabatic steam nozzle operates steadily under the following conditions. Inlet: superheated vapor, $p = 1 \text{ MPa}$, $T = 300^\circ\text{C}$, $A = 78.54 \text{ cm}^2$; Exit: saturated vapor, $p = 100 \text{ kPa}$. Determine (a) the exit velocity (m/s), (b) the rate of entropy generation (kW/K). The mass flow rate is 1 kg/s .

SOLUTION

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1, T_1, A_1, \dot{m}_1):

$$v_1 = 0.2579 \frac{\text{m}^3}{\text{kg}}; \quad h_1 = 3051.1 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 7.1228 \frac{\text{kJ}}{\text{kg}};$$

$$V_1 = \frac{\dot{m}v_1}{A_1}; \quad \Rightarrow V_1 = \frac{(1)(0.2579)}{0.007854}; \quad \Rightarrow V_1 = 32.84 \frac{\text{m}}{\text{s}};$$

State-2 (given $p_2, x_2, \dot{m}_2 = \dot{m}_1$):

$$v_1 = 1.694 \frac{\text{m}^3}{\text{kg}}; \quad h_1 = 2675.5 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 7.3593 \frac{\text{kJ}}{\text{kg}};$$

(a) From the energy balance equation, we have

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\begin{aligned}\Rightarrow 0 &= \dot{m} \left(h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000} \right); & (\text{since } \dot{W}_{\text{ext}} = \dot{Q} \cong 0, \text{ and } \Delta p_e \cong 0) \\ \Rightarrow V_2^2 &= (2000(h_1 - h_2) + V_1^2); \\ \Rightarrow V_2 &= \sqrt{(2000(h_1 - h_2) + V_1^2)}; \\ \Rightarrow V_2 &= \sqrt{(2000(3051.1 - 2675.5) + 32.84^2)}; \\ \Rightarrow V_2 &= 867.34 \frac{\text{m}}{\text{s}}\end{aligned}$$

(b) From the entropy balance equation, we have

$$\begin{aligned}\frac{dS^0}{dt} &= \dot{m}(s_1 - s_2) + \frac{\dot{Q}^0}{T_B} + \dot{S}_{\text{gen,univ}}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= \dot{m}(s_2 - s_1); \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= (7.3593 - 7.1228); \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= 0.237 \frac{\text{kW}}{\text{K}}\end{aligned}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-31 [WV] Two options are available for reduction of pressure for superheated R-134a flowing steadily at 500 kPa and 40°C to a pressure of 100 kPa. In the first option, the vapor is allowed to expand through an isentropic nozzle. In the second option, a valve is used to throttle the flow down to the desired pressure. (a) Determine the temperature of the flow at the exit for each option. (b) **What-if scenario:** How would the answer change for the second option if R-134a is treated as an ideal gas?

SOLUTION

Use TEST or the manual approach to determine the anchor states – state-1 is the inlet state, let state-2 be the exit state for the first case (i.e the isentropic nozzle flow) and state-3 be the exit state for the second case (i.e flow through the throttle valve).

State-1 (given p_1 , T_1):

$$h_1 = 282.48 \frac{\text{kJ}}{\text{kg}}; s_1 = 1.0011 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

(a.1) State-2 (given p_2 , $s_2 = s_1$):

$$T_2 = -10.22^\circ \text{C}$$

(a.2) State-3 (given $p_3 = p_2$, $h_3 = h_1$):

$$T_3 = 32.49^\circ \text{C}$$

4-1-32 [WC] Steam enters an adiabatic nozzle steadily at 3 MPa, 670 K, 50 m/s, and exits at 2 MPa. If the nozzle has an inlet area of 7 cm² and an adiabatic efficiency of 90%. Determine (a) the exit velocity and (b) the rate of entropy generation in the nozzle's universe. Neglect pe. (c) **What-if scenario:** How would the conclusion in (a) change if the adiabatic efficiency was 80%?

SOLUTION

State-1 (given p_1 , T_1 , V_1):

$$h_1 = 3223.51 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 6.909 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}; \quad v_1 = 0.0988 \frac{\text{m}^3}{\text{kg}};$$

$$\dot{m}_1 = \frac{A_1 V_1}{v_1}; \quad \Rightarrow \dot{m}_1 = \frac{(0.0007)(50)}{0.0988}; \quad \Rightarrow \dot{m}_1 = 0.35425 \frac{\text{kg}}{\text{s}};$$

State-2 (given p_2 , $s_2 = s_1$):

$$h_2 = 3109.25 \frac{\text{kJ}}{\text{kg}}; \quad v_2 = 0.13537 \frac{\text{m}^3}{\text{kg}};$$

State-3 (given $p_3 = p_2$, η , $\dot{m}_3 = \dot{m}_1$):

$$h_3 = h_1 - 0.9(h_1 - h_2); \quad \Rightarrow h_3 = 3223.51 - (0.9)(3223.51 - 3109.25); \quad \Rightarrow h_3 = 3120.67 \frac{\text{kJ}}{\text{kg}};$$

$$s_3 = 6.92895 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}; \quad v_3 = 0.13669 \frac{\text{m}^3}{\text{kg}};$$

(a) The energy balance for the steady flow system can be expressed as

© 2016 Pearson Education, Inc., Hoboken, NJ. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.

$$\begin{aligned}\frac{dE^0}{dt} &= \dot{m}(j_1 - j_3) + \dot{Q} - \dot{W}_{\text{ext}}; \\ \Rightarrow j_1 &= j_3; \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2) \\ \Rightarrow h_1 + ke_1 &= h_3 + ke_3; \\ \Rightarrow h_1 - h_3 &= \frac{V_3^2 - V_1^2}{2000}; \\ \Rightarrow V_3 &= \sqrt{(2000(h_1 - h_3) + V_1^2)}; \\ \Rightarrow V_3 &= \sqrt{(2000(3223.51 - 3120.67) + 50^2)}; \\ \Rightarrow V_3 &= 456.27 \frac{\text{m}}{\text{s}}\end{aligned}$$

(b) The entropy equation, applied to the overall adiabatic system produces

$$\begin{aligned}\frac{dS^0}{dt} &= \dot{m}_1 s_1 - \dot{m}_2 s_3 + \frac{\dot{Q}}{T_B} + \dot{S}_{\text{gen,univ}}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= \dot{m}(s_3 - s_1); \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= (0.35425)(6.92895 - 6.909); \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= 0.0070 \frac{\text{kW}}{\text{K}}\end{aligned}$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-33 [WY] Steam enters an insulated nozzle steadily at 0.7 MPa, 200°C, 50 m/s, and exits at 0.18 MPa and velocity of 650 m/s. If the nozzle has an inlet area of 0.5 m². Determine (a) the exit temperature, (b) mass flow rate and (c) the rate of entropy generation in the nozzle's universe. Neglect PE. (d) Draw an entropy flow diagram for the device.

SOLUTION

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1 , T_1 , V_1):

$$h_1 = 2844.66 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 6.885 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}; \quad v_1 = 0.29989 \frac{\text{m}^3}{\text{kg}};$$

State-2 (given p_2 , V_2)

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow j_1 = j_2; \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0 \text{ and } \dot{m}_1 = \dot{m}_2)$$

$$\Rightarrow h_1 + ke_1 = h_2 + ke_2;$$

$$\Rightarrow h_1 - h_2 = \frac{V_2^2 - V_1^2}{2000};$$

$$\Rightarrow h_2 = h_1 - \left(\frac{V_2^2 - V_1^2}{2000} \right);$$

$$\Rightarrow h_2 = 2844.66 - \left(\frac{650^2 - 50^2}{2000} \right);$$

$$\Rightarrow h_2 = 2634.66 \frac{\text{kJ}}{\text{kg}};$$

$$\therefore s_2 = 6.9904 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}; \quad T_2 = 116.9^\circ \text{C}$$

(b) The mass flow rate is

$$\dot{m} = \dot{m}_1 = \dot{m}_2;$$

$$\dot{m} = \frac{A_1 V_1}{v_1}; \quad \Rightarrow \dot{m} = \frac{(0.5)(50)}{0.29989}; \quad \Rightarrow \dot{m} = 83.36 \frac{\text{kg}}{\text{s}}$$

(c) The entropy equation, applied to the overall adiabatic system produces

$$\frac{dS^0}{dt} = \dot{m}_1 s_1 - \dot{m}_2 s_2 + \frac{\dot{Q}^0}{T_B} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = (83.36)(6.9904 - 6.885);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 8.79 \frac{\text{kW}}{\text{K}}$$

(d) Entropy Flow Diagram:

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-34 [WQ] Steam flows steadily through an isentropic nozzle with a mass flow rate of 10 kg/s. At the inlet the conditions are: 1 MPa, 1000°C, and 10 m/s, and at the exit the pressure is 100 kPa. Determine the flow area at (a) the inlet and (b) the exit. (c) Determine the area of cross-section at an intermediate state where the flow velocity is 500 m/s. (d) Draw an approximate shape of the nozzle.

SOLUTION

State-1 (given p_1 , T_1 , V_1 , \dot{m}_1):

$$h_1 = 4637.6 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 8.9118 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}; \quad v_1 = 0.5871 \frac{\text{m}^3}{\text{kg}};$$

State-2 (given p_2 , $s_2 = s_1$, $\dot{m}_2 = \dot{m}_1$):

$$h_2 = 3552.0 \frac{\text{kJ}}{\text{kg}}; \quad s_2 = 8.9118 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}; \quad v_2 = 3.702 \frac{\text{m}^3}{\text{kg}};$$

State-3 (given V_3 , $s_3 = s_1$)

From the energy balance equation, we have

For state-2:

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow 0 = \dot{m}(j_1 - j_2); \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0)$$

$$\Rightarrow 0 = h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000};$$

$$\Rightarrow V_2^2 = 2000(h_1 - h_2) + V_1^2;$$

$$\Rightarrow V_2 = \sqrt{2000(h_1 - h_2) + V_1^2};$$

$$\Rightarrow V_2 = \sqrt{2000(4637.6 - 3552.0) + 10^2};$$

$$\Rightarrow V_2 = 1473.5 \frac{\text{m}}{\text{s}};$$

For state-3:

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_3) + \cancel{\dot{Q}^0} - \cancel{\dot{W}_{\text{ext}}^0};$$

$$\Rightarrow 0 = \dot{m}(j_1 - j_3); \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0)$$

$$\Rightarrow 0 = h_1 - h_3 + \frac{V_1^2 - V_3^2}{2000};$$

$$\Rightarrow h_3 = h_1 + \frac{V_1^2 - V_3^2}{2000};$$

$$\Rightarrow h_3 = 4637.6 + \frac{10^2 - 500^2}{2000};$$

$$\Rightarrow h_3 = 4512.65 \frac{\text{kJ}}{\text{kg}};$$

Knowing specific entropy and specific enthalpy for state-3,

$$v_3 = 0.7032 \frac{\text{m}^3}{\text{kg}};$$

From the mass balance equation, we have

$$\frac{dm^0}{dt} = \sum \dot{m}_i - \sum \dot{m}_e;$$

$$\dot{m} = \rho AV;$$

$$(a) \dot{m}_1 = \rho_1 A_1 V_1;$$

$$\Rightarrow A_1 = \frac{\dot{m}_1 v_1}{V_1};$$

$$\Rightarrow A_1 = \frac{(10)(0.5871)}{(10)};$$

$$\Rightarrow A_1 = 0.5871 \text{ m}^2$$

$$(b) \rho_1 A_1 V_1 = \rho_2 A_2 V_2;$$

$$\Rightarrow A_2 = \frac{v_2}{v_1} \frac{V_1}{V_2} A_1;$$

$$\Rightarrow A_2 = \left(\frac{3.702}{0.5871} \right) \left(\frac{10}{1437.5} \right) (0.5871);$$

$$\Rightarrow A_2 = 0.0257 \text{ m}^2$$

$$(c) \rho_1 A_1 V_1 = \rho_3 A_3 V_3;$$

$$\Rightarrow A_3 = \frac{v_3}{v_1} \frac{V_1}{V_3} A_1;$$

$$\Rightarrow A_3 = \left(\frac{0.7032}{0.5871} \right) \left(\frac{10}{500} \right) (0.5871);$$

$$\Rightarrow A_3 = 0.0141 \text{ m}^2$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-35 [WT] In problem 4-1-34 [WQ], determine the minimum area of cross-section of the steam nozzle. (Hint: Use TEST and vary the flow velocity in the intermediate station until the flow area is minimized.)

TEST Solution:

Launch the PC single-flow TESTcalc and load the TEST-code from problem 4-1-34. In State-3 (the intermediate state), change velocity Vel3 and click Super-Calculate to update the area A3. After a few iterations, the minimum area is found to be $A_3 = 0.0117 \text{ m}^2$. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-36 [WF] Carbon dioxide (CO₂) enters a nozzle at 35 psia, 1400oF and 250 ft/s and exits at 12 psia and 1200oF. Assuming the nozzle to be adiabatic and the surroundings to be at 14.7 psia and 65oF. Determine (a) the exit velocity and (b) the entropy generation rate in the nozzle's universe.

SOLUTION

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1, T_1, V_1)

State-2 (given p_2, T_2)

(a) The energy balance for the steady flow system can be expressed as

$$\left(\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0, \Delta p_e \cong 0, \left(\text{Here, } 1 \frac{\text{btu}}{\text{lbm}} = 25037 \frac{\text{ft}^2}{\text{s}^2} \right) \right)$$

$$\dot{m} \left(h_1 + \frac{V_1^2}{(2)(25037)} \right) = \dot{m} \left(h_2 + \frac{V_2^2}{(2)(25037)} \right);$$

$$\Rightarrow h_1 - h_2 = \frac{V_2^2 - V_1^2}{50074};$$

$$\Rightarrow V_2 = \sqrt{(50074(h_1 - h_2) + V_1^2)};$$

$$\Rightarrow V_2 = \sqrt{(50074(343.94 - 285.30) + 250^2)};$$

$$\Rightarrow V_2 = 1731.7 \frac{\text{ft}}{\text{s}}$$

(b) The rate of entropy generation

$$\frac{dS^0}{dt} = \dot{m}(s_1 - s_2) + \frac{\dot{\Phi}^0}{T_0} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow 0 = \dot{m} \left(c_p \ln \frac{T_1}{T_2} - R \ln \frac{p_1}{p_2} \right) + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow 0 = \left(0.29679 \ln \frac{(1859.67)}{(1659.67)} - 0.04512 \ln \frac{(35)}{(12)} \right) + \dot{S}_{\text{gen,univ}}$$

$$\Rightarrow 0 = 0.0338 - 0.0483 + \dot{S}_{\text{gen,univ}}$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = (0.0145)(60);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 0.87 \frac{\text{Btu}}{\text{R} \cdot \text{min}}$$

TEST Solution and What-if Scenario:

Launch the IG single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-37 [WM] Air (use the PG model) expands in an isentropic horizontal nozzle from inlet conditions of 1.0 MPa, 850 K, 100 m/s to an exhaust pressure of 100 kPa. (a) Determine the exit velocity. **What-if Scenario:** What would the exit velocity be (b) if the inlet kinetic energy were neglected in the energy equation? (c) if the nozzle were vertical with the exhaust plane 4.0 m above the intake plane?

SOLUTION

State-1 (given p_1, T_1, V_1)

State-2 (given $p_2, s_2 = s_1$)

$$\frac{T_2}{T_1} = \left(\frac{p_2}{p_1} \right)^{\frac{k-1}{k}} ;$$

$$T_2 = T_1 \left(\frac{p_2}{p_1} \right)^{\frac{k-1}{k}} ;$$

$$\Rightarrow T_2 = (850) \left(\frac{100}{1000} \right)^{\frac{1.4-1}{1.4}} ;$$

$$\Rightarrow T_2 = 440 \text{ K};$$

(a) The energy balance for the steady flow system can be expressed as

(Since $\dot{Q} \cong 0$, $\dot{W}_{\text{ext}} = 0$, $\Delta p_e \cong 0$)

$$0 = \dot{m} \left(h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000} \right);$$

$$\Rightarrow V_2 = \sqrt{2000(h_1 - h_2) + V_1^2};$$

$$\Rightarrow V_2 = \sqrt{2000c_p(T_1 - T_2) + V_1^2};$$

$$\Rightarrow V_2 = \sqrt{2000(1.003)(850 - 440) + 100^2};$$

$$\Rightarrow V_2 = 912.4 \frac{\text{m}}{\text{s}}$$

TEST Solution and What-if Scenario:

Launch the PG single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-38 [WD] Air enters an adiabatic nozzle steadily at 400kPa, 200oC and 35m/s and leaves at 150kPa and 180 m/s. The inlet area of the nozzle is 75cm². Determine (a) the mass flow rate, (b) the exit temperature of the air, and (c) the exit area of the nozzle, and (d) the rate of entropy generation in the nozzle's universe. Use the IG model for air.

SOLUTION

State-1 (given p_1, T_1, A_1, V_1):

$$v_1 = \frac{RT_1}{p_1}; \quad \Rightarrow v_1 = \frac{(0.287)(473)}{(400)}; \quad \Rightarrow v_1 = 0.339 \frac{\text{m}^3}{\text{kg}}$$

$$h_1 = h_{@200^\circ\text{C}} = 475.2 \frac{\text{kJ}}{\text{kg}}$$

State-2 (given p_2, V_2)

$$(a) \quad \dot{m} = \frac{V_1 A_1}{v_1}; \quad \Rightarrow \dot{m} = \frac{(35)(0.0075)}{(0.339)}; \quad \Rightarrow \dot{m} = 0.774 \frac{\text{kg}}{\text{s}}$$

(b) The energy balance for the steady flow system can be expressed as

$$\dot{m} \left(h_1 + \frac{V_1^2}{2} \right) = \dot{m} \left(h_2 + \frac{V_2^2}{2} \right); \quad (\text{Since } \dot{Q} \cong 0, \dot{W}_{\text{ext}} = 0, \Delta p_e \cong 0)$$

$$\Rightarrow h_2 = h_1 - \frac{V_2^2 - V_1^2}{2};$$

$$\Rightarrow h_2 = (475.2) - \frac{(180)^2 - (35)^2}{2000};$$

$$\Rightarrow h_2 = 459.6 \frac{\text{kJ}}{\text{kg}};$$

$$\therefore T_2 = 457 \text{ K} = 184^\circ\text{C}$$

(c) The exit area of the nozzle

$$v_2 = \frac{RT_2}{p_2}; \quad \Rightarrow v_2 = \frac{(0.287)(457)}{(150)}; \quad \Rightarrow v_2 = 0.874 \frac{\text{m}^3}{\text{kg}};$$

$$\dot{m} = \frac{V_2 A_2}{v_2}; \quad \Rightarrow 0.774 = \frac{(180)(A_2)}{(0.874)}; \quad \Rightarrow A_2 = \frac{(0.874)(0.774)}{(180)};$$

$$\Rightarrow A_2 = 0.00375 \text{ m}^2 = 37.5 \text{ cm}^2$$

(d) The rate of entropy generation

$$\frac{dS}{dt} = \dot{m}(s_1 - s_2) + \frac{\dot{\Phi}}{T_0} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow 0 = \dot{m}(c_p \ln \frac{T_1}{T_2} - R \ln \frac{p_1}{p_2}) + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow 0 = (0.774)(1.005 \ln \frac{(200)}{(184)} - 0.287 \ln \frac{(400)}{(150)}) + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow 0 = (-0.1919) + \frac{(0)}{(25)} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 0.1919 \frac{\text{kW}}{\text{K}}$$

TEST Solution:

Launch the IG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-44 [WW] Air at 100kPa, 15°C and 250 m/s enters an insulated diffuser of a jet engine steadily. The inlet area of the diffuser is 0.5 m². The air leaves the diffuser with a low velocity. Determine (a) the mass flow rate of the air and (b) the temperature of the air leaving the diffuser.

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, A_1, V_1):

$$\rho_1 = \frac{p_1}{RT_1}; \quad \Rightarrow \rho_1 = 1.21 \frac{\text{kg}}{\text{m}^3};$$

$$(a) \dot{m} = \rho_1 A_1 V_1; \quad \Rightarrow \dot{m} = (1.21)(0.5)(250); \quad \Rightarrow \dot{m} = 151.16 \frac{\text{kg}}{\text{s}}$$

(b) From the energy balance equation

$$\dot{J}_1 = \dot{J}_2;$$

$$\Rightarrow h_1 + \text{ke}_1 = h_2 + \text{ke}_2;$$

$$\Rightarrow h_2 - h_1 = \text{ke}_1 - \text{ke}_2;$$

$$\Rightarrow c_p (T_2 - T_1) = \text{ke}_1;$$

$$\Rightarrow T_2 = 15 + \frac{250^2}{(2000)(1.005)};$$

$$\Rightarrow T_2 = 46.09^\circ\text{C}$$

TEST Solution:

Launch the PG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-45 [ORR] Air at 100kPa, 12oC, and 300 m/s enters the adiabatic diffuser of a jet engine steadily. The inlet area of the diffuser is 0.4 m². The air leaves at 150 kPa and 20 m/s. Determine (a) the mass flow rate of the air, (b) the temperature of the air leaving the diffuser, and (c) the rate of entropy generation in the diffuser's universe. Neglect pe.

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1 , T_1 , V_1 , A_1)

State-2 (given p_2 , V_2 , \dot{m})

(a) $\dot{m} = \rho A_1 V_1$; $\Rightarrow \dot{m} = (1.22)(0.4)(300)$; $\Rightarrow \dot{m} = 146.63 \frac{\text{kg}}{\text{s}}$

(b) Using the PG model to evaluate the temperature of the air leaving the diffuser

$$\dot{j}_1 = \dot{j}_2;$$

$$\begin{aligned}
\Rightarrow h_1 + \frac{V_1^2}{2000} &= h_2 + \frac{V_2^2}{2000}; \\
\Rightarrow \frac{V_2^2}{2000} - \frac{V_1^2}{2000} &= h_1 - h_2; \\
\Rightarrow \frac{V_2^2}{2000} - \frac{V_1^2}{2000} &= c_p(T_1 - T_2); \\
\Rightarrow T_2 &= 285 - \frac{20^2 - 300^2}{(2000)(1.005)}; \\
\Rightarrow T_2 &= 329.57 \text{ K} = \mathbf{56.57^\circ\text{C}}
\end{aligned}$$

(c) The rate of entropy generation

$$\begin{aligned}
\frac{dS^0}{dt} &= \dot{m}(s_1 - s_2) + \frac{\dot{\Phi}^0}{T_0} + \dot{S}_{\text{gen,univ}}; \\
\Rightarrow 0 &= \dot{m} \left(c_p \ln \frac{T_1}{T_2} - R \ln \frac{p_1}{p_2} \right) + \dot{S}_{\text{gen,univ}}; \\
\Rightarrow 0 &= (146.63) \left(1.005 \ln \frac{(329.57)}{(285)} - 0.287 \ln \frac{(150)}{(100)} \right) + \dot{S}_{\text{gen,univ}}; \\
\Rightarrow \dot{S}_{\text{gen,univ}} &= \mathbf{4.39 \frac{\text{kW}}{\text{K}}}
\end{aligned}$$

TEST Solution:

Launch the PG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-46 [WJ] Nitrogen enters an adiabatic diffuser at 75 kPa, -23°C and 240 m/s. The inlet diameter of the diffuser is 80 mm. It leaves at 100 kPa, and 21 m/s. Determine (a) the mass flow rate of the air, (b) the temperature of the air leaving the diffuser, and (c) the rate of entropy generation in the diffuser's universe. Neglect PE.

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, A_1, V_1):

$$\rho_1 = \frac{p_1}{RT_1}; \quad \Rightarrow \rho_1 = 1.009 \frac{\text{kg}}{\text{m}^3};$$

State-2 (given p_2, V_2)

$$(a) \quad \dot{m} = \rho_1 A_1 V_1; \quad \Rightarrow \dot{m} = (1.009)(0.005)(240); \quad \Rightarrow \dot{m} = 1.21 \frac{\text{kg}}{\text{s}}$$

(b) Using the PG model to evaluate the temperature of the air leaving the diffuser

$$j_1 = j_2;$$

$$\begin{aligned}
\Rightarrow h_1 + ke_1 &= h_2 + ke_2; \\
\Rightarrow ke_2 - ke_1 &= h_1 - h_2; \\
\Rightarrow ke_2 - ke_1 &= c_p(T_1 - T_2); \\
\Rightarrow T_2 &= 250 - \frac{21^2 - 240^2}{(2000)(1.039)}; \\
\Rightarrow T_2 &= 277.5 \text{ K} = 4.5^\circ\text{C}
\end{aligned}$$

(c) The change in entropy between the inlet and exit can be evaluated using the PG model.

$$\begin{aligned}
\Delta s &= s_2 - s_1; \\
\Rightarrow \Delta s &= c_p \ln \frac{T_2}{T_1} - R \ln \frac{p_2}{p_1}; \\
\Rightarrow \Delta s &= (1.039) \ln \frac{277.5}{250} - (0.296) \ln \frac{100}{75}; \\
\Rightarrow \Delta s &= 0.0234 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}
\end{aligned}$$

The rate of entropy generation

$$\begin{aligned}
\frac{dS^0}{dt} &= \dot{m}(s_1 - s_2) + \frac{\dot{\mathcal{Q}}^0}{T_0} + \dot{S}_{\text{gen,univ}}; \\
\Rightarrow 0 &= \dot{m}\Delta s + \dot{S}_{\text{gen,univ}}; \\
\Rightarrow \dot{S}_{\text{gen,univ}} &= -\dot{m}\Delta s; \\
\Rightarrow 0 &= (1.21)(0.0234) + \dot{S}_{\text{gen,univ}}; \\
\Rightarrow \dot{S}_{\text{gen,univ}} &= -0.028 \frac{\text{kJ}}{\text{K}}
\end{aligned}$$

TEST Solution:

Launch the PG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-47 [ORB] Air enters an insulated diffuser operating at steady state at 100 kPa, -5°C and 250 m/s and exits with a velocity of 125 m/s. Neglecting any change in pe and thermodynamic friction, determine: (a) The temperature of air at the exit. (b) The pressure at the exit. (c) The exit-to-inlet area ratio.

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1 , T_1 , V_1)

State-2 (given V_2 , $s_2 = s_1$)

(a) The energy balance for the steady flow system can be expressed as
(Since $\dot{Q} \cong 0$, $\dot{W}_{\text{ext}} = 0$, $\Delta pe \cong 0$)

$$0 = \dot{m} \left(h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000} \right);$$

$$\begin{aligned}\Rightarrow h_2 - h_1 &= \frac{V_1^2 - V_2^2}{2000}; \\ \Rightarrow h_2 - h_1 &= \frac{250^2 - 125^2}{2000}; \\ \Rightarrow h_2 - h_1 &= 23.4375; \\ \Rightarrow c_p (T_2 - T_1) &= 23.4375; \\ \Rightarrow T_2 &= T_1 + \frac{23.4375}{c_p}; \\ \Rightarrow T_2 &= -5 + \frac{23.4375}{1.003}; \\ \Rightarrow T_2 &= 18.37^\circ\text{C}\end{aligned}$$

(b) The isentropic relations provide

$$\begin{aligned}\frac{p_2}{p_1} &= \left(\frac{T_2}{T_1} \right)^{\frac{k}{k-1}}; \\ p_2 &= p_1 \left(\frac{T_2}{T_1} \right)^{\frac{k}{k-1}}; \\ \Rightarrow p_2 &= (100) \left(\frac{291.37}{268} \right)^{\frac{1.4}{1.4-1}}; \\ \Rightarrow p_2 &= 134 \text{ kPa}\end{aligned}$$

$$\begin{aligned}\text{(c)} \quad \frac{v_1}{v_2} &= \left(\frac{p_2}{p_1} \right)^{\frac{1}{k}}; \\ \Rightarrow \frac{v_1}{v_2} &= \left(\frac{134}{100} \right)^{\frac{1}{1.4}}; \\ \Rightarrow \frac{v_1}{v_2} &= 1.233; \\ \Rightarrow \frac{v_2}{v_1} &= 0.811;\end{aligned}$$

From the mass balance equation:

$$\frac{dm}{dt} = \sum \dot{m}_i - \sum \dot{m}_e;$$

$$\dot{m} = \rho AV;$$

$$\rho_1 A_1 V_1 = \rho_2 A_2 V_2;$$

$$\frac{A_2}{A_1} = \frac{v_2}{v_1} \frac{V_1}{V_2};$$

$$\Rightarrow \frac{A_2}{A_1} = (0.811) \left(\frac{250}{125} \right);$$

$$\Rightarrow \frac{A_2}{A_1} = 1.622$$

TEST Solution:

Launch the PG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-48 [ORO] Repeat problem 4-1-41 [ORB] assuming thermodynamic friction in the diffuser causes its efficiency to go down to 85%.

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1 , T_1 , V_1)

State-2 (given V_2 , $s_2 = s_1$)

(a) The energy balance for the steady flow system can be expressed as

(Since $\dot{Q} \cong 0$, $\dot{W}_{\text{ext}} = 0$, $\Delta p_e \cong 0$)

$$0 = \dot{m} \left(0.85(h_1 - h_2) + \frac{V_1^2 - V_2^2}{2000} \right);$$

$$\Rightarrow h_2 - h_1 = \frac{V_1^2 - V_2^2}{0.85(2000)};$$

$$\Rightarrow h_2 - h_1 = \frac{250^2 - 125^2}{0.85(2000)};$$

$$\Rightarrow h_2 - h_1 = 27.5735;$$

$$\Rightarrow c_p(T_2 - T_1) = 27.5735;$$

$$\Rightarrow T_2 = T_1 + \frac{27.5735}{c_p};$$

$$\Rightarrow T_2 = -5 + \frac{27.5735}{1.003};$$

$$\Rightarrow T_2 = 22.5^\circ\text{C}$$

(b) The isentropic relations provide

$$\frac{p_2}{p_1} = \left(\frac{T_2}{T_1} \right)^{\frac{k}{k-1}};$$

$$p_2 = p_1 \left(\frac{T_2}{T_1} \right)^{\frac{k}{k-1}};$$

$$\Rightarrow p_2 = (100) \left(\frac{295.5}{268} \right)^{\frac{1.4}{1.4-1}};$$

$$\Rightarrow p_2 = 140.8 \text{ kPa}$$

(c) $\frac{v_1}{v_2} = \left(\frac{p_2}{p_1} \right)^{\frac{1}{k}};$

$$\Rightarrow \frac{v_1}{v_2} = \left(\frac{140.8}{100} \right)^{\frac{1}{1.4}};$$

$$\Rightarrow \frac{v_1}{v_2} = 1.277;$$

$$\Rightarrow \frac{v_2}{v_1} = 0.783;$$

From the mass balance equation:

$$\frac{dm}{dt} = \sum \dot{m}_i - \sum \dot{m}_e;$$

$$\dot{m} = \rho AV;$$

$$\rho_1 A_1 V_1 = \rho_2 A_2 V_2;$$

$$\frac{A_2}{A_1} = \frac{v_2}{v_1} \frac{V_1}{V_2};$$

$$\Rightarrow \frac{A_2}{A_1} = (0.783) \left(\frac{250}{125} \right);$$

$$\Rightarrow \frac{A_2}{A_1} = 1.566$$

TEST Solution:

Launch the PG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-49 [BCX] Air at 100 kPa, 15°C, and 300 m/s enters the adiabatic diffuser of a jet engine steadily. The inlet area of the diffuser is 0.4 m², and exit area of the diffuser is 1 m². Using the Diffuser Simulator (linked from the left margin), calculate (a) exit pressure (p₂), (b) exit temperature (T₂).

4-1-52 [ORH] Steam enters a turbine operating at steady state with a mass flow rate of 1.5 kg/s. At the inlet, the pressure is 6 MPa, the temperature is 500°C, and the velocity is 20 m/s. At the exit, the pressure is 0.5 MPa, the quality is 0.95 (95%), and the velocity is 75 m/s. The turbine develops a power output of 2500 kW. Determine (a) the rate of heat transfer (b) *What-if scenario:* How would the answer change if ke was neglected at the inlet and exit?

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, \dot{m}_1):

$$h_1 = 3422.21 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given $p_2, x_2, \dot{m}_2 = \dot{m}_1$):

$$h_f + x_2 h_{fg} = [640.23 + (.95)(2108.5)] = 2643.30 \frac{\text{kJ}}{\text{kg}};$$

(a) From the energy balance equation on the steady turbine, we have

$$\dot{Q} = \dot{m}(j_2 - j_1) + \dot{W}_T;$$

$$\Rightarrow \dot{Q} = \dot{m}(h_2 - h_1 + \frac{V_2^2 - V_1^2}{2000}) + \dot{W}_T; \quad (\text{since } \Delta pe \cong 0)$$

$$\Rightarrow \dot{Q} = 1.5(2643.30 - 3422.2 + \frac{75^2 - 20^2}{2000}) + 2500;$$

$$\Rightarrow \dot{Q} = 1335.5 \text{ kW} = \mathbf{1.336 \text{ MW}}$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-53 [ORS] Steam enters an adiabatic turbine steadily at 6 MPa and 530°C, and exits at 2.5 MPa, 420°C. The mass flow rate is 0.127 kg/s. Determine (a) the external power, (b) the ratio of exit flow area to the inlet flow area to keep the exit velocity equal to the inlet velocity. Neglect ke and pe .

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, \dot{m}_1):

$$h_1 = 3493.19 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given $p_2, T_2, \dot{m}_2 = \dot{m}_1$):

$$h_2 = 3283.85 \frac{\text{kJ}}{\text{kg}};$$

(a) From the energy balance equation on the steady turbine, we have

$$\dot{W}_T = \dot{m}(j_1 - j_2);$$

$$\Rightarrow \dot{W}_T = \dot{m}(h_1 - h_2); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta ke = \Delta pe \cong 0)$$

$$\Rightarrow \dot{W}_T = 0.127(3492.19 - 3283.85);$$

$$\Rightarrow \dot{W}_T = \mathbf{26.58 \text{ kW}}$$

(b) The ratio of exit flow area to the inlet flow area to keep the exit velocity equal to the inlet velocity is

$$\dot{m} = \frac{A_1 V}{v_1}; \quad \dot{m} = \frac{A_2 V}{v_2}; \quad (V_1 = V_2)$$

$$\Rightarrow \frac{A_2}{A_1} = \frac{v_2}{v_1};$$

$$\Rightarrow \frac{A_2}{A_1} = \frac{0.12411}{0.0592};$$

$$\Rightarrow \frac{A_2}{A_1} = 2.09$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-54 [ORA] Steam enters a turbine steadily at 2.5 MPa, 350°C, 60 m/s, and exits at 0.2 MPa, 100% quality, and 230 m/s. The mass flow rate into the turbine is 1.7 kg/s, and the heat transfer from the turbine is 8 kW. Determine (a) the power output of the turbine and (b) the energetic efficiency. (c) Draw an energy flow diagram for the turbine.

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, V_1, \dot{m}_1):

$$h_1 = 3126.21 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given $p_2, x_2, V_2, \dot{m}_2 = \dot{m}_1$):

$$h_2 = 2706.62 \frac{\text{kJ}}{\text{kg}};$$

(a) From the energy balance equation on the steady turbine, we have

$$\dot{W}_T = \dot{m}(j_1 - j_2) - \dot{Q};$$

$$\Rightarrow \dot{W}_T = \dot{m}\left(h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000}\right) - \dot{Q}; \quad (\text{since } \Delta p_e \cong 0)$$

$$\Rightarrow \dot{W}_T = 1.7 \left(3126.21 - 2706.624 + \frac{60^2 - 230^2}{2000} \right) - 8;$$

$$\Rightarrow \dot{W}_T = \mathbf{663.39 \text{ kW}}$$

(b) The energetic efficiency

© 2016 Pearson Education, Inc., Hoboken, NJ. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.

$$\eta_1 = \frac{\dot{m}(j_2 - j_1)}{-\dot{W}_{\text{ext}}};$$

$$\Rightarrow \eta_1 = \frac{\dot{Q} - \dot{W}_{\text{ext}}}{-\dot{W}_{\text{ext}}};$$

$$\Rightarrow \eta_1 = \frac{(8) - (663.4)}{-(663.4)};$$

$$\Rightarrow \eta_1 = 98.8 \%$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-55 [ORN] Steam enters a turbine steadily at 10 MPa, 550 oC, 50 m/s, and exits at 25 kPa and 95% quality. The inlet and exit areas are 150 cm² and 4000 cm² respectively. A heat loss of 50 kJ/kg occurs in the turbine. Determine (a) the mass flow rate, (b) exit velocity, and (c) the power output. (d) **What-if scenario:** How would the answers in parts (b) and (c) change if the turbine was redesigned with an exit area of 5000 cm²?

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, A_1, V_1):

$$h_1 = 3500.94 \frac{\text{kJ}}{\text{kg}}; \quad v_1 = 0.03564 \frac{\text{m}^3}{\text{kg}};$$

State-2 (given p_2, x_2, A_2):

$$h_2 = h_f + x_2 h_{fg} = [271 + (.95)(2346.3)] = 2499.98 \frac{\text{kJ}}{\text{kg}};$$

$$v_2 = 5.8948 \frac{\text{m}^3}{\text{kg}};$$

(a) From the mass balance equation on the steady turbine, we have

$$\dot{m} = \frac{A_1 V_1}{v_1} = \frac{(0.015)(50)}{0.03564} = 21.04 \frac{\text{kg}}{\text{s}}$$

$$(b) V_2 = \frac{\dot{m} v_2}{A_2} = \frac{(21.04)(5.8948)}{0.4} = 310.06 \frac{\text{m}}{\text{s}}$$

© 2016 Pearson Education, Inc., Hoboken, NJ. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.

(c) From the energy balance equation on the steady turbine, we have

$$\begin{aligned}\dot{W}_T &= \dot{m}(j_1 - j_2) - \dot{Q}; \\ \Rightarrow \dot{W}_T &= \dot{m} \left(h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000} \right) - \dot{Q}; \quad (\text{since } \Delta p_e \cong 0) \\ \Rightarrow \dot{W}_T &= 21.04 \left(3500.9 - 2499.98 + \frac{50^2 - 310.06^2}{2000} \right) - (50)(21.04); \\ \Rightarrow \dot{W}_T &= \mathbf{19.022 \text{ MW}}\end{aligned}$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study.

The TEST-code for this problem can be found in the TEST-Pro site

at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-56 [ORE] Steam enters an adiabatic turbine steadily at 6 MPa and 600°C, 50 m/s, and exits at 50 kPa, 100°C, 150 m/s. The turbine produces 5 MW. Determine (a) the mass flow rate. Neglect p_e . (b) *What-if scenario:* How would the answer change if k_e was also neglected?

SOLUTION

Let state-1 represent the inlet and state-2 the exit state.

State-1 (given p_1, T_1, V_1):

$$h_1 = 3658.37 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given p_2, T_2, V_2):

$$h_2 = 2682.36 \frac{\text{kJ}}{\text{kg}};$$

(a) From the energy balance equation on the steady turbine, we have

$$\dot{W}_T = \dot{m}(j_1 - j_2);$$

$$\Rightarrow \dot{W}_T = \dot{m} \left(h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000} \right); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta p_e \cong 0)$$

$$\Rightarrow \dot{m} = \frac{\dot{W}_T}{\left(h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000} \right)};$$

$$\Rightarrow \dot{m} = \frac{5000}{\left(3658.37 - 2682.36 + \frac{50^2 - 150^2}{2000} \right)};$$

$$\Rightarrow \dot{m} = 5.17 \frac{\text{kg}}{\text{s}}$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study.

The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-57 [ORI] Steam enters an adiabatic turbine steadily at 2.5 MPa and 450 oC, and exits at 60 kPa, 100oC. If the power output of the turbine is 3 MW, determine (a) the mass flow rate, (b) the isentropic efficiency, and (c) the rate of internal entropy generation in the turbine.

SOLUTION

Let state-1 represent the inlet, state-2 the exit state and state-3 the isentropic exit state.

State-1 (given p_1, T_1):

$$h_1 = 3350.80 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 7.174 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given p_2, T_2):

$$h_2 = 2681.07 \frac{\text{kJ}}{\text{kg}}; \quad s_2 = 7.603 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-3 (given $p_3 = p_2, s_3 = s_1$):

$$h_3 = 2524.85 \frac{\text{kJ}}{\text{kg}};$$

(a) From the energy balance equation on the steady turbine, we have

$$\dot{W}_T = \dot{m}(h_1 - h_2); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta \text{ke} = \Delta \text{pe} \cong 0)$$

$$\Rightarrow \dot{m} = \frac{\dot{W}_T}{(h_1 - h_2)};$$

$$\Rightarrow \dot{m} = \frac{3000}{(3350.80 - 2681.07)};$$

$$\Rightarrow \dot{m} = 4.48 \frac{\text{kg}}{\text{s}}$$

(b) Isentropic work:

$$\dot{W}_{T,s} = \dot{m}(h_1 - h_2); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta \text{ke} = \Delta \text{pe} \cong 0)$$

$$\Rightarrow \dot{W}_{T,s} = 4.48(3350.80 - 2524.85);$$

$$\Rightarrow \dot{W}_{T,s} = 3700.3 \text{ kW};$$

The isentropic efficiency now can be evaluated as

$$\eta_T \equiv \frac{\dot{W}_T}{\dot{W}_{T,s}} = \frac{3000.0}{3700.3} = 81.1\%$$

(c) The entropy balance equation, applied on the turbine's universe produces

$$\frac{dS^0}{dt} = \dot{m}(s_1 - s_2) + \frac{\dot{\Phi}^0}{T_0} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = (4.48)(7.603 - 7.174);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 1.92 \frac{\text{kW}}{\text{K}}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-58 [ORL] Steam enters an adiabatic turbine, operating at steady state, with a flow rate of 10 kg/s at 1000 kPa, 400°C and leaves at 40°C with a quality of 0.9 (90%). Neglecting changes in ke and pe , determine (a) the pressure (in kPa) at the turbine exit, (b) the turbine output in MW, and (c) the rate of entropy generation, (d) **What-if Scenario:** If the exit velocity was to be limited to 30 m/s, what would be the required exit area in m²?

SOLUTION

Let state-1 represent the inlet, state-2 the exit state and state-3 the isentropic exit state.

State-1 (given p_1, T_1, \dot{m}_1):

$$h_1 = 3263.86 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 7.4649 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given $T_2, x_2, \dot{m}_2 = \dot{m}_1$):

$$h_2 = 2333.61 \frac{\text{kJ}}{\text{kg}}; \quad s_2 = 7.4887 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

(a) $p_2 = p_{\text{sat}@40^\circ\text{C}} = 7.38 \text{ kPa}$

(b) From the energy balance equation on the steady turbine, we have

$$\dot{W}_T = \dot{m}(h_1 - h_2); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta ke = \Delta pe \cong 0)$$

$$\Rightarrow \dot{W}_T = (10)(3263.86 - 2333.61);$$

$$\Rightarrow \dot{W}_T = 9302.5 \text{ kW} = 9.3 \text{ MW}$$

(c) From the entropy balance equation on the steady turbine, we have

$$\begin{aligned}\dot{S}_{\text{gen,univ}} &= \dot{m}(s_2 - s_1); \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= (10)(7.4887 - 7.4649); \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= 0.238 \frac{\text{kW}}{\text{K}}\end{aligned}$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-59 [ORG] Steam enters an adiabatic turbine steadily at 5 MPa and 540 oC, with a mass flow rate of 5 kg/s and leaves at 75 kPa. The isentropic efficiency of the turbine is 0.90. Determine (a) the temperature at the exit of the turbine and (b) the power output of the turbine. (c) Draw energy and entropy flow diagrams for the turbine.

SOLUTION

Let state-1 represent the inlet, state-2 the exit state and state-3 the isentropic exit state.

State-1 (given p_1, T_1, \dot{m}_1):

$$h_1 = 3526.91 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 7.092 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given $p_2, \dot{m}_2 = \dot{m}_1$)

State-3 (given $p_3 = p_2, s_3 = s_1, \dot{m}_3 = \dot{m}_1$):

$$h_3 = 2529.93 \frac{\text{kJ}}{\text{kg}};$$

The efficiency of the turbine is:

$$\eta_T \equiv \frac{\dot{W}_T}{\dot{W}_{T,s}} = \frac{h_1 - h_2}{h_1 - h_3} = 0.9;$$

$$h_2 = h_1 - (0.9(h_1 - h_3));$$

$$\Rightarrow h_2 = 3526.91 - (0.9(3526.91 - 2529.93));$$

$$\Rightarrow h_2 = 2629.63 \frac{\text{kJ}}{\text{kg}};$$

(a) The temperature at 75 kPa and specific enthalpy of $2629.63 \frac{\text{kJ}}{\text{kg}}$

$$T_2 = 91.7^\circ\text{C}$$

(b) From the energy balance equation on the steady turbine, we have

$$\dot{W}_T = \dot{m}(j_1 - j_2);$$

$$\Rightarrow \dot{W}_T = \dot{m}(h_1 - h_2); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta \text{ke} = \Delta \text{pe} \cong 0)$$

$$\Rightarrow \dot{W}_T = 5(3526.91 - 2629.63);$$

$$\Rightarrow \dot{W}_T = 4486 \text{ kW}$$

(c) Energy and entropy flow diagram.

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-60 [ORP] A hydroelectric power plant operates at steady state. The difference of elevation between the upstream and downstream reservoirs is 600 m. For a discharge of 150 m³/s, determine the maximum power output. Use the SL model for water.

SOLUTION

Let state-1 represent the inlet, and state-2 the exit state.

Given:

$$\Delta z = 600 \text{ m}$$

State-1 (given p_1, T_1)

State-2 (given $p_2 = p_1, T_2 = T_1$)

At room temperature the density of water is $997 \frac{\text{kg}}{\text{m}^3}$

The mass flow rate becomes

$$\dot{m} = \rho \dot{V} = (997)(150);$$

$$\Rightarrow \dot{m} = 149550 \frac{\text{kg}}{\text{s}};$$

From the energy balance equation for the steady state, we have

$$\dot{W}_T = \dot{m} \left(g \frac{\Delta z}{1000} \right); \quad (\text{since } \dot{Q} \cong 0, \Delta h \cong 0, \text{ and } \Delta ke \cong 0)$$

$$\Rightarrow \dot{W}_T = 149550 \left(9.8 \frac{600}{1000} \right);$$

$$\Rightarrow \dot{W}_T = 879.4 \text{ MW}$$

TEST Solution:

Launch the SL single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-61 [ORZ] Hot gases enter a well-insulated jet engine turbine with a velocity of 50 m/s, a temperature of 1000°C, and a pressure of 600 kPa. The gases exit the turbine at a pressure of 250 kPa and a velocity of 75 m/s. Assume isentropic steady flow and that the hot gases behave as a perfect gas with mean molar mass of 25 and specific heat ratio of 1.38. (a) Find the turbine power per unit mass of the working fluid. (b) *What-if scenario:* How would the answer change if the hot gases were modeled as cold air?

SOLUTION

The specific heat ratio of hot gases $k=1.38$. The constant pressure specific heat is

$$c_p = 1.20772 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

Let state-1 represent the inlet, state-2 the isentropic exit state.

State-1 (given p_1, T_1, V_1)

State-2 (given $p_2, s_2 = s_1, V_2$):

$$T_2 = T_1 \left(\frac{p_2}{p_1} \right)^{\frac{(k-1)}{k}} = (1273) \left(\frac{250}{600} \right)^{\frac{(1.38-1)}{1.38}} = 1000.3 \text{ K};$$

(a) Using the energy equation

$$0 = \dot{m}(j_1 - j_2) + \dot{\mathcal{Q}} - \dot{W}_T;$$

$$\Rightarrow \dot{W}_T = \dot{m}c_p(T_1 - T_2);$$

$$\Rightarrow w_T = 1.20772(1273 - 1000.3);$$

$$\Rightarrow w_T = 329.3 \frac{\text{kJ}}{\text{kg}}$$

TEST Solution and What-if Scenario:

Launch the PG single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-62 [ORK] A turbine at steady state receives air at a pressure of 5 bar and a temperature of 120°C. Air exits the turbine at a pressure of 1 bar. The work developed is measured as 100 kJ per kg of air flowing through the turbine. The turbine operates adiabatically, and change in ke and pe can be neglected. Determine (a) the turbine efficiency, and (b) the entropy generated per kg of air flow in the turbine's universe. Use the PG model for air. (c) *What-if scenario:* How would the answers change if the IG model was used?

SOLUTION

The specific heat ratio of air $k=1.4$. The constant pressure specific heat of air is

$$c_p = 1.00349 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

Let state-1 represent the inlet, state-2 the exit state and state-3 the isentropic exit state.

State-1 (given p_1, T_1)

State-2 (given p_2)

State-3 (given $p_3 = p_2, s_3 = s_1$):

$$T_3 = T_1 \left(\frac{p_3}{p_1} \right)^{\frac{(k-1)}{k}} = (393.15) \left(\frac{100}{500} \right)^{\frac{(1.4-1)}{1.4}} = 248.23 \text{ K};$$

Isentropic work:

© 2016 Pearson Education, Inc., Hoboken, NJ. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.

$$\begin{aligned}
 \dot{W}_{T,s} &= \dot{m}(j_1 - j_3); \\
 &\Rightarrow \dot{W}_{T,s} = \dot{m}c_p(T_1 - T_3); \\
 &\Rightarrow \dot{W}_{T,s} = 1.00349(393.15 - 248.23); \\
 &\Rightarrow \dot{W}_{T,s} = 145.4 \text{ kW};
 \end{aligned}$$

(a) The isentropic efficiency now can be evaluated as

$$\eta_T \equiv \frac{\dot{W}_T}{\dot{W}_{T,s}} = \frac{100.0}{145.4} = 68.7\%$$

(b) The entropy balance equation, applied on the turbine's universe produces

$$\begin{aligned}
 \frac{dS^0}{dt} &= \dot{m}(s_1 - s_2) + \frac{\dot{\Phi}^0}{T_0} + \dot{S}_{\text{gen,univ}}; \\
 &\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m} \left(c_p \ln \frac{T_2}{T_1} - R \ln \frac{p_2}{p_1} \right); \\
 &\Rightarrow \dot{S}_{\text{gen,univ}} = \left(1.00349 \ln \frac{293.15}{393.15} - 0.2869 \ln \frac{100}{500} \right); \\
 &\Rightarrow \dot{S}_{\text{gen,univ}} = 0.167 \frac{\text{KW}}{\text{K}}
 \end{aligned}$$

TEST Solution and What-if Scenario:

Launch the IG single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-63 [ORC] Steam at 4 MPa, 600°C enters an insulated turbine operating at steady state with a mass flow rate of 5 kg/s and exits at 200 kPa. Determine (a) the maximum theoretical power that can be developed by the turbine, and (b) the corresponding exit temperature. Also determine (b) the isentropic efficiency if steam exits the turbine at 220°C.

SOLUTION

Let state-1 represent the inlet, state-2 the exit state and state-3 the isentropic exit state.

State-1 (given p_1, T_1):

$$h_1 = 3674.41 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 7.368 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given p_2, T_2):

$$h_2 = 2910.64 \frac{\text{kJ}}{\text{kg}}; \quad s_2 = 7.587 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-3 (given $p_3 = p_2, s_3 = s_1$):

$$h_3 = 2808.76 \frac{\text{kJ}}{\text{kg}};$$

(a) The maximum theoretical power that can be developed (i.e. the isentropic work)

$$\dot{W}_{T,s} = \dot{m}(j_1 - j_3);$$

$$\Rightarrow \dot{W}_{T,s} = \dot{m}(h_1 - h_3); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta ke = \Delta pe \cong 0)$$

$$\Rightarrow \dot{W}_{T,s} = 5(3674.41 - 2808.76);$$

$$\Rightarrow \dot{W}_{T,s} = 4328.25 \text{ kW}$$

(b) At 200 kPa and enthalpy of 2808.76 $\frac{\text{kJ}}{\text{kg}}$

$$T_3 = 169.9^\circ\text{C}$$

(c) Actual Work

From the energy balance equation on the steady turbine, we have

$$\dot{W}_T = \dot{m}(j_1 - j_2);$$

$$\Rightarrow \dot{W}_T = \dot{m}(h_1 - h_2); \quad (\text{since } \dot{Q} \cong 0, \text{ and } \Delta ke = \Delta pe \cong 0)$$

$$\Rightarrow \dot{W}_T = 5(3674.41 - 2910.64);$$

$$\Rightarrow \dot{W}_T = 3818.85 \text{ kW};$$

The isentropic efficiency now can be evaluated as

$$\eta_T \equiv \frac{\dot{W}_T}{\dot{W}_{T,s}} = \frac{3818.85}{4328.25} = 88.2\%$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-64 [ORU] Combustion gases enters an adiabatic gas turbine steadily at 850 kPa and 850 oC, with a mass flow rate of 1 kg/s and leaves at 420 kPa. Treating the combustion gases as air with variable specific heat and assuming an isentropic efficiency of 86 %, determine the work output of the turbine.

SOLUTION

State-1 (given p_1, T_1, \dot{m}_1):

$$h_1 = 890.28 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given $p_2, s_2 = s_1, \dot{m}_2 = \dot{m}_1$):

$$h_2 = 681.95 \frac{\text{kJ}}{\text{kg}}; \quad T_2 = 940.7 \text{ K};$$

State-3 (given $p_3 = p_2, \eta, \dot{m}_3 = \dot{m}_1$):

$$\begin{aligned} h_3 &= h_1 - (0.86(h_1 - h_2)); \\ \Rightarrow h_3 &= 890.28 - (0.86(890.28 - 681.95)); \\ \Rightarrow h_3 &= 711.12 \frac{\text{kJ}}{\text{kg}}; \end{aligned}$$

The energy balance for the steady flow system can be expressed as

$$\frac{dE}{dt} = \dot{m}(j_1 - j_3) + \dot{Q} - \dot{W}_T;$$

$$\Rightarrow \dot{W}_T = \dot{m}(h_1 - h_3); \quad (\text{Since } \dot{Q} \cong 0, \text{ke} \cong \text{pe} \cong 0)$$

$$\Rightarrow \dot{W}_T = 890.28 - 711.12;$$

$$\Rightarrow \dot{W}_T = 179.16 \text{ kW}$$

TEST Solution:

Launch the IG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-65 [ORX] Steam (H₂O) enters a steady isentropic turbine with a mass flow rate of 10 kg/s at 3 MPa, 800°C and leaves at 100 kPa. Determine the power produced by the turbine using (a) the PC model for steam, (b) the PG model and (c) the IG model.

SOLUTION

(a) PC model:

State-1 (given p_1, T_1, \dot{m}_1):

$$h_1 = 4145.9 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 7.9862 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given $p_2, s_2 = s_1, \dot{m}_2 = \dot{m}_1$):

$$h_2 = 2950.9 \frac{\text{kJ}}{\text{kg}};$$

From the energy balance equation

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_T;$$

$$\Rightarrow \dot{W}_T = \dot{m}(h_1 - h_2);$$

$$\Rightarrow \dot{W}_T = (10)(4145.9 - 2950.9);$$

$$\Rightarrow \dot{W}_T = 11950 \text{ kW} = \mathbf{11.95 \text{ MW}}$$

(b) PG model:

Given:

$$c_p = 1.8677 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

$$k = 1.327;$$

State-1 (given p_1, T_1, \dot{m}_1)

State-2 (given $p_2, s_2 = s_1, \dot{m}_2 = \dot{m}_1$):

$$\frac{T_2}{T_1} = \left(\frac{p_2}{p_1} \right)^{\frac{k-1}{k}}; \Rightarrow T_2 = T_1 \left(\frac{p_2}{p_1} \right)^{\frac{k-1}{k}} = 1073 \left(\frac{100}{3000} \right)^{\frac{0.327}{1.327}} = 464 \text{ K};$$

From the energy balance equation

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q}^0 - \dot{W}_T;$$

$$\Rightarrow \dot{W}_T = \dot{m}(h_1 - h_2);$$

$$\Rightarrow \dot{W}_T = \dot{m}c_p(T_1 - T_2);$$

$$\Rightarrow \dot{W}_T = (10)(1.8677)(1073 - 464);$$

$$\Rightarrow \dot{W}_T = 11374 \text{ kW} = 11.37 \text{ MW}$$

(c) IG model:

Using the IG tables:

Given:

$$R = 0.461 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

$$\bar{M} = 18.015 \frac{\text{kg}}{\text{kmol}};$$

State-1 (given p_1, T_1, \dot{m}_1):

$$\bar{h}_1 \cong 39000 \frac{\text{kJ}}{\text{kmol}};$$

State-2 (given $p_2, s_2 = s_1, \dot{m}_2 = \dot{m}_1$):

$$\bar{h}_2 \cong 17200 \frac{\text{kJ}}{\text{kmol}};$$

From the energy balance equation

$$\begin{aligned}\frac{dE}{dt}^0 &= \dot{m}(j_1 - j_2) + \dot{Q}^0 - \dot{W}_T; \\ \Rightarrow \dot{W}_T &= \frac{\dot{m}(\bar{h}_1 - \bar{h}_2)}{\bar{M}}; \\ \Rightarrow \dot{W}_T &= \frac{(10)(39000 - 17200)}{18.015}; \\ \Rightarrow \dot{W}_T &= 12101 \text{ kW} = \mathbf{12.10 \text{ MW}}\end{aligned}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-66 [ORV] Steam enters an adiabatic turbine steadily at 6 MPa, 600 oC, 50 m/s, and exits at 50 kPa, 100oC and 150 m/s. The turbine produces 5 MW. If the ambient condition is 100 kPa, 25oC. (a) Determine the entropy generation rate by the device and the surroundings (turbine's universe). (b) Draw an entropy flow diagram for the turbine.

SOLUTION

State-1 (given p_1 , T_1 , V_1):

$$h_1 = 3658.37 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 7.167 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given p_2 , T_2 , V_2 , $\dot{m}_2 = \dot{m}_1$):

$$h_2 = 2682.36 \frac{\text{kJ}}{\text{kg}}; \quad s_2 = 7.688 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

From the energy balance equation on the steady turbine, we have

$$0 = \dot{m}(j_1 - j_2) + \dot{\mathcal{Q}}^0 - \dot{W}_T;$$

$$\Rightarrow \dot{W}_T = \dot{m} \left(h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000} \right); \quad (\text{since } \Delta p_e \cong 0, \dot{\mathcal{Q}} = 0, \dot{m}_1 = \dot{m}_1)$$

$$\Rightarrow 5 = \dot{m} \left(3658.37 - 2682.36 + \frac{50^2 - 150^2}{2000} \right);$$

$$\Rightarrow \dot{m} = 0.005 \frac{\text{kg}}{\text{s}};$$

(a) The entropy balance equation, applied on the turbine's universe produces

$$\begin{aligned}\frac{dS^0}{dt} &= \dot{m}(s_1 - s_2) + \frac{\dot{\Phi}^0}{T_0} + \dot{S}_{\text{gen,univ}}; \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= \dot{m}(s_2 - s_1); \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= (0.005)(7.688 - 7.167); \\ \Rightarrow \dot{S}_{\text{gen,univ}} &= 0.0026 \frac{\text{kW}}{\text{K}}\end{aligned}$$

TEST Solution:

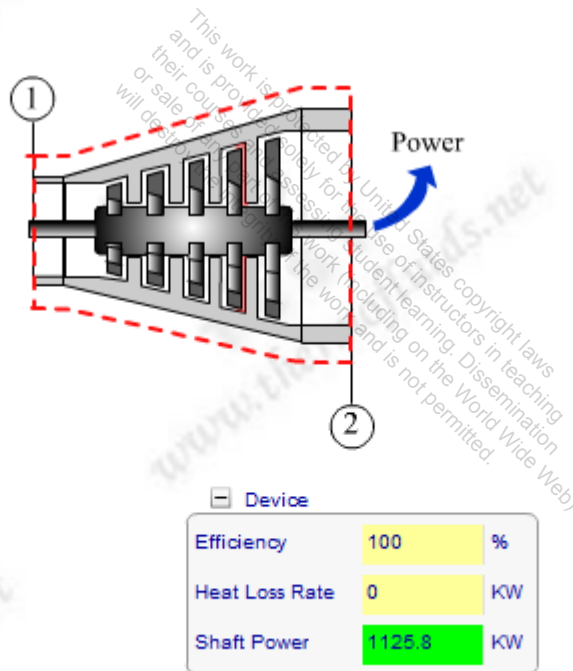

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-67 [BCN] Steam enters an adiabatic turbine steadily at 2.5 MPa, 350°C, 10 m/s and exits at 1 MPa, 30 m/s. The mass flow rate (\dot{m}) is 5 kg/s. Using the Turbine Simulator RIA (linked from the left margin), determine the shaft power (\dot{W}_{sh}).

SOLUTION

4-1-71 [BVN] Air enters an adiabatic turbine steadily at 6 MPa, 600°C, 50 m/s and exits at 50 kPa, 150 m/s with a mass flow rate (\dot{m}) of 6 kg/s. Assuming the turbine efficiency to be 90%, use Turbine Simulator RIA (linked from left margin) to (a) determine shaft power (W_{sh}), (b) plot how shaft power (W_{sh}) varies with turbine efficiency varying from 70% to 90%, all other input variables remaining unchanged.

SOLUTION

(a)

The screenshot shows the Turbine Simulator RIA interface. At the top, there are buttons for 'Calculate', 'Initialize', and 'Parametric Study', and a dropdown menu set to 'Air'. Below these are two state parameter tables:

State 1		State 2	
T1	873 K	T2	299.036 K
p1	6000 kPa	p2	50 kPa
A1	0.005034 sq. m	A2	0.068966 sq. m
V1	50 m/s	V2	150 m/s
mdot	6 kg/s		

Below the tables is a schematic of a turbine with inlet (1) and outlet (2) ports. A blue arrow labeled 'Power' points from the turbine to the 'Device' settings table:

Device	
Efficiency	90 %
Heat Loss Rate	0 KW
Shaft Power	3587.246 KW

4-1-72 [ORY] Refrigerant R-134a enters a compressor at 175 kPa and -10°C and leaves at 1 MPa, 60°C. The mass flow rate is 0.02 kg/s and the power output to the compressor is 1.2 kW. Determine (a) the heat transfer rate from the compressor. (b) Draw an energy diagram for the device. Assume steady-state operation.

SOLUTION

State-1 (given p_1 , T_1 , \dot{m}_1):

$$h_1 = 244.11 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 0.946 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given p_2 , T_2 , $\dot{m}_2 = \dot{m}_1$):

$$h_2 = 292.89 \frac{\text{kJ}}{\text{kg}}; \quad s_2 = 0.982 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

(a) From the energy balance equation on the steady state, we have

$$\begin{aligned} 0 &= \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}}; \\ &\Rightarrow -\dot{Q} = \dot{m}(h_1 - h_2) - \dot{W}_{\text{ext}}; \quad (\text{since } \Delta \text{ke} \cong \Delta \text{pe} \cong 0) \\ &\Rightarrow -\dot{Q} = 0.02(244.11 - 292.89) + 1.2; \\ &\Rightarrow \dot{Q} = -0.224 \text{ kW} \end{aligned}$$

(b) Energy Diagram

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

SOLUTION

$$\dot{m}_1 = \frac{\dot{V}_1}{v_1} = \frac{0.0166}{0.162} = 0.1027 \frac{\text{kg}}{\text{s}};$$

$$h_2 = 279.8 \frac{\text{kJ}}{\text{kg}};$$
$$h_3 = \frac{h_1 - (h_1 - h_2)}{0.85} = 287.6 \frac{\text{kJ}}{\text{kg}};$$

$$s_3 = 0.967 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

$$\begin{aligned}
0 &= \dot{m}(j_1 - j_2) + \dot{\mathcal{Q}}^0 - \dot{W}_{\text{ext}}; \\
\Rightarrow \dot{W}_{\text{ext}} &= \dot{m}(h_1 - h_2); \quad (\text{since } \dot{\mathcal{Q}} \cong 0, \Delta \text{ke} \cong \Delta \text{pe} \cong 0) \\
\Rightarrow \dot{W}_C &= \dot{m}(h_2 - h_1); \\
\Rightarrow \dot{W}_C &= 0.1027(287.6 - 235.5); \\
\Rightarrow \dot{W}_C &= \mathbf{5.35 \text{ kW}}
\end{aligned}$$

(b) Using the entropy balance equation

$$\begin{aligned}
\frac{dS^0}{dt} &= \dot{m}(s_1 - s_3) + \frac{\dot{\mathcal{Q}}^0}{T_0} + \dot{S}_{\text{gen,univ}}; \\
\Rightarrow \dot{S}_{\text{gen,univ}} &= \dot{m}(s_3 - s_1); \\
\Rightarrow \dot{S}_{\text{gen,univ}} &= (0.1027)(0.967 - 0.943); \\
\Rightarrow \dot{S}_{\text{gen,univ}} &= \mathbf{0.00247 \frac{\text{kW}}{\text{K}}}
\end{aligned}$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-74 [ORW] Refrigerant-12 enters a compressor operating at steady state as saturated vapor at -7°C and exits at 1000 kPa . The compressor has an isentropic efficiency of 75% . Ignoring the heat transfer between the compressor and its surrounding as well as ke and pe , determine (a) the exit temperature, and (b) work input in kJ per kg of refrigerant flow.

SOLUTION

State-1 (given T_1, x_1):

$$h_1 = 184.5 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 0.7 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given $p_2, s_2 = s_1$):

$$h_2 = 209.8 \frac{\text{kJ}}{\text{kg}};$$

State-3 (given $p_3 = p_2, \eta = 75\%$):

$$h_3 = \frac{h_1 - (h_1 - h_2)}{0.75} = 218.2 \frac{\text{kJ}}{\text{kg}};$$

$$s_3 = 0.725 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

(a) $T_3 = 61^{\circ}\text{C}$

(b) From the energy balance equation on the steady state, we have

$$0 = \dot{m}(j_1 - j_3) + \dot{Q}^0 - W_{\text{ext}};$$

$$\Rightarrow w_{\text{ext}} = (h_1 - h_3); \quad (\text{since } Q \cong 0, \Delta ke \cong \Delta pe \cong 0)$$

$$\Rightarrow w_C = (h_3 - h_1);$$

$$\Rightarrow w_C = (218.2 - 184.5);$$

$$\Rightarrow w_C = 33.7 \frac{\text{kJ}}{\text{kg}}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. 4-1-76 [ORQ] Argon gas enters an adiabatic compressor at 100 kPa and 25°C with a velocity of 20 m/s and exits at 1 MPa, 550°C and 100 m/s. The inlet area of the compressor is 75 cm². Assuming the surroundings to be at 100 kPa and 25°C, determine (a) the internal entropy generation rate by this device, (b) the external entropy generation in the immediate surroundings, and (c) the entropy generation in the system's universe.

SOLUTION

The specific heat ratio of hot gases $k = 1.6$. The constant pressure specific heat is

$$c_p = 0.5203 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

Let state-1 represent the inlet, state-2 the exit state.

State-1 (given p_1, T_1, A_1, V_1):

$$\dot{m}_1 = \frac{A_1 V_1}{v_1} = \frac{(0.0075)(20)}{0.6204} = 0.242 \frac{\text{kg}}{\text{s}};$$

State-2 (given p_2, T_2, V_2)

(a) The entropy generated in the device

$$S_{\text{gen, system}} = \Delta S_{\text{system}} = \dot{m}(s_2 - s_1);$$

$$\begin{aligned}\Rightarrow S_{\text{gen,system}} &= \dot{m}(s_2 - s_1); \\ \Rightarrow S_{\text{gen,system}} &= \dot{m} \left(c_p \ln \frac{T_2}{T_1} - R \ln \frac{p_2}{p_1} \right); \\ \Rightarrow S_{\text{gen,system}} &= 0.242 \left((0.5203) \ln \frac{823}{298} - (0.2081) \ln \frac{1000}{100} \right); \\ \Rightarrow S_{\text{gen,system}} &= 0.012 \frac{\text{kW}}{\text{K}}\end{aligned}$$

(b) The entropy generated in the immediate surrounding

$$S_{\text{gen,surrounding}} = \Delta S_{\text{surrounding}} = \frac{\dot{Q}}{T_B} = 0 \frac{\text{kW}}{\text{K}}$$

(c) The entropy generation in the systems universe

$$\begin{aligned}S_{\text{gen,univ}} &= \Delta S_{\text{system}} + \Delta S_{\text{surrounding}}; \\ \Rightarrow S_{\text{gen,univ}} &= 0.012 + 0 = 0.012 \frac{\text{kW}}{\text{K}}\end{aligned}$$

TEST Solution:

Launch the PG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-77 [ORD] Air enters an adiabatic compressor at steady state at a pressure of 100 kPa, a temperature of 20°C, and a flow rate of 0.25 m³/s. Compressed air is discharged from the compressor at 800 kPa and 270°C. Given that the inlet and exit pipe diameters are 4 cm, determine (a) the exit velocity of air at the compressor outlet and (b) the compressor power. Use PG model for air. (c) **What-if scenario:** How would the compressor power change if the pipe diameters at the inlet and exit were 5 cm?

SOLUTION

The specific heat ratio of hot gases $k = 1.4$. The constant pressure specific heat is

$$c_p = 1.003 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

Let state-1 represent the inlet, state-2 the exit.

State-1 (given p_1, T_1, \dot{V}_1):

$$A_1 = 0.00126;$$

$$\dot{m}_1 = \frac{\dot{V}_1}{v_1} = \frac{0.25}{0.8413} = 0.297 \frac{\text{kg}}{\text{s}};$$

$$V_1 = \frac{(0.297)(0.8413)}{0.00126} = 198.3 \frac{\text{m}}{\text{s}};$$

State-2 (given $p_2, T_2, A_2 = A_1, \dot{m}_2 = \dot{m}_1$):

$$(a) V_2 = \frac{\dot{m}_2 v_2}{A_2} = \frac{(0.297)(0.195)}{0.00126} = 45.9 \frac{\text{m}}{\text{s}}$$

(b) Using the energy equation

$$0 = \dot{m}(j_1 - j_2) + \dot{\mathcal{Q}}^0 - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{W}_{\text{ext}} = \dot{m} \left(h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000} \right);$$

$$\Rightarrow \dot{W}_{\text{ext}} = \dot{m} \left(c(T_1 - T_2) + \frac{V_1^2 - V_2^2}{2000} \right);$$

$$\Rightarrow \dot{W}_C = \dot{m} \left(c(T_2 - T_1) + \frac{V_2^2 - V_1^2}{2000} \right);$$

$$\Rightarrow \dot{W}_C = 0.297 \left(1.003(543 - 293) + \frac{45.9^2 - 198.9^2}{2000} \right);$$

$$\Rightarrow \dot{W}_C = \mathbf{68.9 \text{ kW}}$$

TEST Solution and What-if Scenario:

Launch the PG single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-78 [ORM] Air from the surrounding atmosphere at 100 kPa, 25oC enters a compressor with a velocity of 7 m/s through an inlet of area 0.1 m². At the exit, the pressure is 600 kPa, the temperature is 150oC, and the velocity is 2m/s. Heat transfer from the compressor to its surrounding occurs at a rate of 3 kW. Determine (a) the power input to the compressor and (b) the rate of entropy generation. Use the PG model for air. (c) *What-if scenario:* How would the conclusion in (a) change if the IG model was used?

SOLUTION

The specific heat ratio of hot gases $k = 1.4$. The constant pressure specific heat is

$$c_p = 1.003 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

Let state-1 represent the inlet, state-2 the exit state.

State-1 (given p_1, T_1, A_1, V_1):

$$\dot{m}_1 = \frac{A_1 V_1}{v_1} = \frac{(0.1)(7)}{0.856} = 0.818 \frac{\text{kg}}{\text{s}};$$

State-2 (given p_2, T_2, V_2)

(a) Using the energy equation

$$0 = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\begin{aligned}\Rightarrow \dot{W}_{\text{ext}} &= \dot{m} \left(h_1 - h_2 + \frac{V_1^2 - V_2^2}{2000} \right) + \dot{Q}; \\ \Rightarrow \dot{W}_{\text{ext}} &= \dot{m} \left(c(T_1 - T_2) + \frac{V_1^2 - V_2^2}{2000} \right) + \dot{Q}; \\ \Rightarrow \dot{W}_C &= \dot{m} \left(c(T_2 - T_1) + \frac{V_2^2 - V_1^2}{2000} \right) - \dot{Q}; \\ \Rightarrow \dot{W}_C &= 0.818 \left(1.003(523 - 298) + \frac{2^2 - 7^2}{2000} \right) - (-3); \\ \Rightarrow \dot{W}_C &= \mathbf{187.6 \text{ kW}}\end{aligned}$$

(b) The entropy generation in the system's universe

$$\begin{aligned}\frac{dS^0}{dt} &= \dot{m}(s_1 - s_2) + \frac{\dot{Q}}{T_B} + \dot{S}_{\text{gen,univ}}; \\ \Rightarrow S_{\text{gen,univ}} &= \dot{m} \left(s_2 - s_1 \right) - \frac{\dot{Q}}{T_B}; \\ \Rightarrow S_{\text{gen,univ}} &= \dot{m} \left(c \ln \frac{T_2}{T_1} - R \ln \frac{p_2}{p_1} \right) - \frac{-3}{298}; \\ \Rightarrow S_{\text{gen,univ}} &= 0.818 \left((1.003) \ln \frac{523}{298} - (0.287) \ln \frac{600}{100} \right) + \frac{3}{298}; \\ \Rightarrow S_{\text{gen,univ}} &= \mathbf{0.05 \frac{\text{kW}}{\text{K}}}\end{aligned}$$

TEST Solution and What-if Scenario:

Launch the PG single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-79 [ORJ] An air compressor operating at steady state receives air at 100 kPa and 25°C. The ratio of pressure at the exit to that at inlet is 5. There is no significant heat transfer between the compressor and its surroundings. Also changes in ke and pe are negligible. If the isentropic compressor efficiency is 75 %, determine (a) the actual power and (b) temperature at the compressor exit. Use the PG model for air. (c) **What-if scenario:** How would the compressor power change if the IG model was used instead?

SOLUTION

The specific heat ratio of hot gases $k = 1.4$. The constant pressure specific heat is

$$c_p = 1.003 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

Let state-1 represent the inlet, state-3 the exit state and state-2 the isentropic exit state.

State-1 (given p_1, T_1, \dot{m}_1)

State-2 (given $p_2 = 5 p_1, s_2 = s_1, \dot{m}_2 = \dot{m}_1$):

$$T_2 = T_1 \left(\frac{p_2}{p_1} \right)^{\frac{(k-1)}{k}} = (298)(5)^{\frac{(1.4-1)}{1.4}} = 472.4 \text{ K};$$

State-3 (given $p_3 = p_2, \eta$):

$$T_3 = \frac{T_1 - (T_1 - T_2)}{0.75} = 530.5 \text{ K} = 257.35^\circ\text{C};$$

(a) Using the energy equation

$$\begin{aligned}
0 &= \dot{m}(j_1 - j_3) + \dot{\mathcal{Q}}^0 - \dot{W}_{\text{ext}}; \\
\Rightarrow \dot{W}_{\text{ext}} &= \dot{m}(h_1 - h_3); \quad (\text{since } \dot{Q} \cong 0, \Delta \text{ke} \cong \Delta \text{pe} \cong 0) \\
\Rightarrow \dot{W}_{\text{ext}} &= \dot{m}(c(T_1 - T_3)); \\
\Rightarrow \dot{W}_C &= \dot{m}(c(T_3 - T_1)); \\
\Rightarrow \dot{W}_C &= 1.003(530.5 - 298); \\
\Rightarrow \dot{W}_C &= 233.2 \text{ kW}
\end{aligned}$$

(b) $T_3 = 257.35^\circ\text{C}$

TEST Solution and What-if Scenario:

Launch the PG single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-80 [OOR] Air is compressed by an adiabatic compressor from 100 kPa and 25°C to 700 kPa and 300°C. Assuming variable specific heats and neglecting the changes in p_e and k_e , determine (a) the isentropic efficiency of the compressor, and (b) the exit temperature of air if the compressor was reversible.

SOLUTION

Let state-1 represent the inlet, state-2 the exit state and state-3 the isentropic exit state.

State-1 (given p_1, T_1, \dot{m}_1):

$$h_1 = 0.0159 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given $p_2, T_2, \dot{m}_2 = \dot{m}_1$):

$$h_2 = 282.2 \frac{\text{kJ}}{\text{kg}};$$

State-3 (given $p_3 = p_2, s_3 = s_1$):

$$h_3 = 222.1 \frac{\text{kJ}}{\text{kg}}; \quad T_3 = 515.6 \text{ K};$$

(a) The isentropic efficiency of compressor is

$$\eta = \frac{h_1 - (h_1 - h_3)}{h_2};$$

$$\Rightarrow \eta = \frac{0.0159 - (0.0159 - 222.1)}{282.2} = 78.7\%$$

(b) $T_3 = 515.6 \text{ K}$

TEST Solution:

Launch the IG single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-84 [BVE] Refrigerant R-134a enters an adiabatic compressor at 175 kPa, -10°C and leaves at 1 MPa. The mass flow rate (\dot{m}) is 0.02 kg/s. Using the Compressor Simulator RIA (linked from left margin), (a) determine the shaft power (\dot{W}_{sh}) of the compressor, (b) plot how shaft power varies with exit pressure varying from 175 kPa to 1 MPa.

SOLUTION

(a)

The screenshot displays the Compressor Simulator RIA interface. At the top left are buttons for 'Calculate', 'Initialize', and 'Parametric Study'. A dropdown menu shows 'R-134a' as the selected refrigerant. Below these are two state property tables:

State 1			State 2		
T1	263	K	T2	321.952	K
p1	175	kPa	p2	1000	kPa
A1	Infinity	sq. m	A2	Infinity	sq. m
V1	0	m/s	V2	0	m/s
mdot	0.02	kg/s	x2	0	fraction

In the center is a schematic diagram of a compressor with a rotating impeller. Inlet is labeled 1 and outlet is labeled 2. A blue arrow labeled 'Power' points into the shaft. Below the diagram is a 'Device' table:

Device		
Efficiency	100	%
Heat Loss Rate	0	KW
Shaft Power	0.739	KW

4-1-85 [OOB] The free surface of the water in the well is 15 m below ground level. This water is to be pumped steadily to an elevation of 20 m above the ground level. Assuming temperature to remain constant and neglecting heat transfer and change in k_e , determine (a) power input to the pump required for steady flow of water at a rate of 2 m³/min. Use the SL model for water. (b) **What-if scenario:** How would the conclusion change if the flow rate was 1.5 m³/min?

SOLUTION

Use the steady state SL model for water, with one inlet and one exit.

The specific heat $c = 4.184 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}$;

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1, T_1, \dot{V}_1, z_1):

$$v_1 = 0.0010 \frac{\text{m}^3}{\text{kg}};$$

$$\dot{m}_1 = \frac{\dot{V}_1}{v_1} = \frac{(0.0333)}{0.0010} = 33.3 \frac{\text{kg}}{\text{s}};$$

State-2 (given $p_2 = p_1, T_2 = T_1, \dot{m}_1 = \dot{m}_2, z_2$):

$$v_2 = 0.0010 \frac{\text{m}^3}{\text{kg}};$$

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{\mathcal{Q}}^0 - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{W}_{\text{ext}} = \dot{m} \left(c(T_1 - T_2)^0 + \frac{g(z_1 - z_2)}{1000} \right);$$

$$\Rightarrow \dot{W}_p = \dot{m} \left(\frac{g(z_2 - z_1)}{1000} \right);$$

$$\Rightarrow \dot{W}_p = (33.3) \left(\frac{9.81(20+15)}{1000} \right);$$

$$\Rightarrow \dot{W}_p = 11.4 \text{ kW}$$

TEST Solution and What-if Scenario:

Launch the SL single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-86 [OOS] Oil with a density of 800 kg/m^3 is pumped from a pressure of 0.6 bar to a pressure of 1.4 bar , and the outlet is 3 m above the inlet. The flow rate is $0.2 \text{ m}^3/\text{s}$, and the inlet and exit areas are 0.06 m^2 and 0.03 m^2 respectively. (a) Assuming the temperature to remain constant and neglecting any heat transfer, determine the power input to the pump in kW. (b) **What-if scenario:** How would the answer change if the change in ke was neglected in the analysis?

SOLUTION

T, K

s, kJ/kg.K

Use the steady state SL model for oil, with one inlet and one exit.

The specific heat $c = 4.2 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}$;

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given $p_1, T_1, \dot{V}_1, \rho_1, A_1$):

$$\dot{m}_1 = \rho_1 \dot{V}_1 = 800(0.2) = 160 \frac{\text{kg}}{\text{s}};$$

$$V_1 = \frac{\dot{m}_1}{\rho_1 A_1} = \frac{160}{800(0.06)} = 3.33 \frac{\text{m}}{\text{s}};$$

State-2 (given $p_2, T_2 = T_1, \dot{m}_1 = \dot{m}_2, z_2, \rho_2 = \rho_1, A_2$):

$$V_2 = \frac{\dot{m}_2}{\rho_2 A_2} = \frac{160}{800(0.03)} = 6.66 \frac{\text{m}}{\text{s}};$$

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{\Phi}^0 - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{W}_{\text{ext}} = \dot{m} \left(c(T_1 - T_2) + v(p_1 - p_2) + \frac{V_1^2 - V_2^2}{2000} + \frac{g(z_1 - z_2)}{1000} \right);$$

$$\Rightarrow \dot{W}_p = \dot{m} \left(v(p_2 - p_1) + \frac{V_2^2 - V_1^2}{2000} + \frac{g(z_2 - z_1)}{1000} \right);$$

$$\Rightarrow \dot{W}_p = (160) \left(\frac{(140 - 60)}{800} + \frac{(6.66^2 - 3.33^2)}{2000} + \frac{9.81(3 - 0)}{1000} \right);$$

$$\Rightarrow \dot{W}_p = 23.4 \text{ kW}$$

TEST Solution and What-if Scenario:

Launch the SL single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-87 [OOA] A pump raises the pressure of water, flowing at a rate of $0.1 \text{ m}^3/\text{s}$, from 70 kPa to a pressure of 150 kPa . The inlet and exit areas are 0.05 m^2 and 0.02 m^2 respectively. Assuming the pump to be isentropic and neglecting any change in p_e , determine (a) the power input to the pump in kW . (b) *What-if scenario:* How would the answer change if the exit area was 0.01 m^2 instead?

SOLUTION

Use the steady state SL model for water, with one inlet and one exit.

The specific heat $c = 4.184 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}$;

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1, \dot{V}_1, A_1):

$$\dot{m}_1 = \frac{\dot{V}_1}{v_1} = \frac{(0.1)}{.001} = 100 \frac{\text{kg}}{\text{s}};$$

$$V_1 = \frac{v_1 \dot{m}_1}{A_1} = \frac{(0.001)(100)}{(0.05)} = 2 \frac{\text{m}}{\text{s}};$$

State-2 (given $p_2, T_2 = T_1, \dot{m}_2 = \dot{m}_1, A_2$):

$$V_2 = \frac{v_2 \dot{m}_2}{A_2} = \frac{(0.001)(100)}{(0.02)} = 5 \frac{\text{m}}{\text{s}};$$

(a) The energy balance for the steady flow system can be expressed as

© 2016 Pearson Education, Inc., Hoboken, NJ. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.

$$\begin{aligned}
\frac{dE}{dt}^0 &= \dot{m}(j_1 - j_2) + \dot{Q}^0 - \dot{W}_{\text{ext}}; \\
\Rightarrow \dot{W}_{\text{ext}} &= \dot{m} \left(c(T_1 - T_2)^0 + v(p_1 - p_2) + \frac{V_1^2 - V_2^2}{2000} \right); \\
\Rightarrow \dot{W}_p &= \dot{m} \left(v(p_2 - p_1) + \frac{V_2^2 - V_1^2}{2000} \right); \\
\Rightarrow \dot{W}_p &= (100) \left(0.001(150 - 70) + \frac{(5^2 - 2^2)}{2000} \right); \\
\Rightarrow \dot{W}_p &= 9.05 \text{ kW}
\end{aligned}$$

TEST Solution and What-if Scenario:

Launch the SL single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-88 [OOH] If the pump above has an adiabatic efficiency of 75%, determine (a) the power input, (b) the exit temperature, and (c) the rate of entropy generation in the pump. Assume the inlet and surroundings temperature to be 25°C.

SOLUTION

Use the steady state SL model for water, with one inlet and one exit.

The specific heat $c = 4.184 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}$;

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1, T_1, \dot{V}_1, A_1):

$$\dot{m}_1 = \frac{\dot{V}_1}{v_1} = \frac{(0.1)}{0.001} = 100 \frac{\text{kg}}{\text{s}};$$

$$V_1 = \frac{v_1 \dot{m}_1}{A_1} = \frac{(0.001)(100)}{(0.05)} = 2 \frac{\text{m}}{\text{s}};$$

State-2 (given $p_2, T_2 = T_1, \dot{m}_2 = \dot{m}_1, A_2$):

$$V_2 = \frac{v_2 \dot{m}_2}{A_2} = \frac{(0.001)(100)}{(0.02)} = 5 \frac{\text{m}}{\text{s}};$$

State-3 (given $p_3 = p_2, \dot{m}_3 = \dot{m}_1, A_3 = A_2, \eta$):

$$V_3 = \frac{v_3 \dot{m}_3}{A_3} = \frac{(0.001)(100)}{(0.02)} = 5 \frac{\text{m}}{\text{s}};$$

(a) The energy balance equation gives

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{Q}^0 - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{W}_{\text{ext}} = \dot{m} \frac{\left(c(T_1 - T_2)^0 + v(p_1 - p_2) + \frac{V_1^2 - V_2^2}{2000} \right)}{\eta};$$

$$\Rightarrow \dot{W}_p = \dot{m} \frac{\left(v(p_2 - p_1) + \frac{V_2^2 - V_1^2}{2000} \right)}{\eta};$$

$$\Rightarrow \dot{W}_p = \frac{(100) \left(0.001(150 - 70) + \frac{(5^2 - 2^2)}{2000} \right)}{0.75};$$

$$\Rightarrow \dot{W}_p = 12.07 \text{ kW}$$

Alternatively:

$$\eta = \frac{\dot{W}_{p,s}}{\dot{W}_p};$$

$$\Rightarrow \dot{W}_p = \frac{\dot{W}_{p,s}}{\eta};$$

$$\Rightarrow \dot{W}_p = \frac{9.05}{0.75};$$

$$\Rightarrow \dot{W}_p = 12.07 \text{ kW}$$

(b) From this information:

$$-12.07 = \dot{m}(j_1 - j_3);$$

$$\begin{aligned}
 \Rightarrow j_1 - j_3 &= -\frac{12.07}{\dot{m}}; \\
 \Rightarrow c(T_1 - T_3) + v(p_1 - p_3) + \frac{V_1^2 - V_3^2}{2000} &= -\frac{12.07}{\dot{m}}; \\
 \Rightarrow T_3 &= T_1 - \frac{v(p_3 - p_1) + \frac{V_3^2 - V_1^2}{2000} - \frac{12.07}{\dot{m}}}{c}; \\
 \Rightarrow T_3 &= 25 - \frac{(0.001)(150 - 70) + \frac{5^2 - 2^2}{2000} - \frac{12.07}{100}}{4.184}; \\
 \Rightarrow T_3 &= \mathbf{25.007^\circ\text{C}}
 \end{aligned}$$

(c) From the entropy balance equation

$$\frac{dS^0}{dt} = \dot{m}(s_1 - s_3) + \frac{\dot{Q}^0}{T_B} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_3 - s_1);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}c \ln \frac{T_3}{T_1};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = (100)(4.184) \ln \left(\frac{298.007}{298} \right);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \mathbf{0.01 \frac{kW}{K}}$$

TEST Solution:

Launch the SL single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-89 [OON] Water at 25°C is being pumped at 1.5 kg/s from an open reservoir through a 10-cm pipe. The open end of the 5-cm discharge pipe is 15 m above the top of the water surface in the reservoir. (a) Neglecting any losses, determine the power required in kW. Assume the temperature to remain unchanged and use the SL model for water. (b) **What-if scenario:** How would the answer change if the PC model was used?

SOLUTION

Use the steady state SL model for water, with one inlet and one exit.

The specific heat $c = 4.184 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}$;

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1, T_1, \dot{m}_1, A_1):

$$V_1 = \frac{v_1 \dot{m}_1}{A_1} = \frac{(0.001)(1.5)}{(0.00785)} = 0.191 \frac{\text{m}}{\text{s}};$$

State-2 (given $p_2, T_2 = T_1, \dot{m}_1 = \dot{m}_2, A_2$):

$$V_2 = \frac{v_2 \dot{m}_2}{A_2} = \frac{(0.001)(1.5)}{(0.00196)} = 0.765 \frac{\text{m}}{\text{s}};$$

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE^0}{dt} = \dot{m}(j_1 - j_2) + \dot{Q}^0 - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{W}_{\text{ext}} = \dot{m} \left(\cancel{c(T_1 - T_2)}^0 + \cancel{v(p_1 - p_2)}^0 + \frac{V_1^2 - V_2^2}{2000} + \frac{g(z_1 - z_2)}{1000} \right);$$

$$\Rightarrow \dot{W}_p = \dot{m} \left(\frac{V_2^2 - V_1^2}{2000} + \frac{g(z_2 - z_1)}{1000} \right);$$

$$\Rightarrow \dot{W}_p = (1.5) \left(\frac{(0.765^2 - 0.191^2)}{2000} + \frac{9.81(15 - 0)}{1000} \right);$$

$$\Rightarrow \dot{W}_p = \mathbf{0.221 \text{ kW}}$$

TEST Solution and What-if Scenario:

Launch the SL single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-90 [OOE] In the above problem, (a) determine the pumping power if the water temperature is 60°C throughout. (b) How high above the free surface of the storage tank the pump can be placed without vapor starting to form at the pump inlet?

SOLUTION

(a) To take into account the temperature effect, we must use the PC model. Using Table B-2

$$v_1 = v_2 = v_{f@60^\circ\text{C}} = 0.001017 \frac{\text{m}^3}{\text{s}}$$

as opposed to $0.001 \frac{\text{m}^3}{\text{s}}$ used in the SL model (problem 4-1-89).

Therefore, V_1 and V_2 are practically unchanged. Also, with the pressure and temperature unchanged between the inlet and exit states, $h_1 = h_2$

The energy balance for the steady flow system can be expressed as

$$\begin{aligned} \frac{dE^0}{dt} &= \dot{m}(j_1 - j_2) + \dot{\phi}^0 - \dot{W}_{\text{ext}}; \\ \Rightarrow \dot{W}_{\text{ext}} &= \dot{m} \left((h_1 - h_2)^0 + \frac{V_1^2 - V_2^2}{2000} + \frac{g(z_1 - z_2)}{1000} \right); \\ \Rightarrow \dot{W}_{\text{ext}} &= (1.5) \left(\frac{(0.191^2 - 0.765^2)}{2000} + \frac{9.81(0 - 15)}{1000} \right); \\ \Rightarrow \dot{W}_{\text{ext}} &= -0.221 \text{ kW} \end{aligned}$$

Therefore, the power input to the pump is **0.221 kW**

(b) From Table B-2, $p_{\text{sat}@60^\circ\text{C}} = 19.94 \text{ kPa}$

Water would start boiling if the inlet pressure is lower than 19.94 kPa. If the pump is housed at an elevation z_1 above the free surface,

$$\begin{aligned} p_0 &= p_1 + \frac{z_1 \rho_1 g}{1000} \\ \Rightarrow z_1 &= \frac{1000(p_0 - p_1)}{\rho_1 g} = \frac{1000v_1(p_0 - p_1)}{g} = \frac{1000(0.001)(100 - 19.94)}{9.81} = \mathbf{8.16 \text{ m}} \end{aligned}$$

4-1-91 [OOG] A 5 kW pump is raising water to an elevation of 25 m from the free surface of a lake. The temperature of water increases by 0.1°C. Neglecting heat transfer and any change in ke , determine (a) the mass flow rate and (b) the entropy generated in the system.

SOLUTION

Use the steady state SL model for water, with one inlet and one exit.

The specific heat $c = 4.184 \frac{\text{kJ}}{\text{kg.K}}$;

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1, T_1)

State-2 (given $p_2, T_2 = T_1 + 0.1, \dot{m}_2 = \dot{m}_1$)

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q}^0 - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{W}_{\text{ext}} = \dot{m} \left(c(T_1 - T_2) + \cancel{v(p_1 - p_2)} + \cancel{\frac{V_1^2 - V_2^2}{2000}} + \frac{g(z_1 - z_2)}{1000} \right);$$

$$\Rightarrow \dot{W}_P = \dot{m} \left(c(T_2 - T_1) + \frac{g(z_2 - z_1)}{1000} \right);$$

$$\Rightarrow \dot{m} = \frac{\dot{W}_P}{c(T_2 - T_1) + \frac{g(z_2 - z_1)}{1000}};$$

$$\Rightarrow \dot{m} = \frac{5}{4.184(0.1) + \frac{9.81(25 - 0)}{1000}};$$

$$\Rightarrow \dot{m} = 7.5 \frac{\text{kg}}{\text{s}}$$

(b) The entropy equation, applied to the overall system produces

$$\frac{dS^0}{dt} = \dot{m}(s_2 - s_1) + \cancel{\frac{\dot{Q}^0}{T_B}} + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m} c \ln \frac{T_2}{T_1};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = (7.5)(4.184) \ln \frac{298.25}{298.15};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 0.01 \frac{\text{kW}}{\text{K}}$$

TEST Solution:

Launch the SL single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-92 [OOL] A small water pump is used in an irrigation system. The pump takes water in from a river at 10°C, 100 kPa at a rate of 4.5 kg/s. The exit line enters a pipe that goes up to an elevation 18 m above the pump and river, where water runs into open channel. Assume the process is adiabatic and that the water stays at 10°C. Determine (a) the required pump power.

SOLUTION

Use the steady state SL model for water, with one inlet and one exit.

The specific heat $c = 4.184 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}$;

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1, T_1, \dot{m}_1)

State-2 (given $p_2 = p_1, T_2 = T_1, \dot{m}_2 = \dot{m}_1, z_2$)

The energy balance for the steady flow system can be expressed as

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q} - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{W}_{\text{ext}} = \dot{m} \left(\cancel{c(T_1 - T_2)^0} + \cancel{v(p_1 - p_2)^0} + \cancel{\frac{V_1^2 - V_2^2}{2000}} + \frac{g(z_1 - z_2)}{1000} \right);$$

$$\Rightarrow \dot{W}_p = \frac{\dot{m}g(z_2 - z_1)}{1000};$$

$$\Rightarrow \dot{W}_p = \frac{(4.5)(9.81)(18 - 0)}{1000};$$

$$\Rightarrow \dot{W}_p = 0.794 \text{ kW}$$

TEST Solution:

Launch the SL single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-93 [OOI] A 5 kW pump is raising water to an elevation of 25 m from the free surface of a lake. The temperature of water increases by 0.1°C. Neglecting any change in k_e , determine (a) the mass flow rate. (b) **What-if scenario:** How would the conclusion change if the pumping power was 10 kW?

SOLUTION

Use the steady state SL model for water, with one inlet and one exit.

The specific heat $c = 4.184 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}$;

Let state-1 represents the inlet state and state-2 the exit state.

State-1 (given p_1, T_1)

State-2 (given $p_2, T_2 = T_1 + 0.1, \dot{m}_2 = \dot{m}_1$)

(a) The energy balance for the steady flow system can be expressed as

$$\frac{dE}{dt} = \dot{m}(j_1 - j_2) + \dot{Q}^0 - \dot{W}_{\text{ext}};$$

$$\Rightarrow \dot{W}_{\text{ext}} = \dot{m} \left(c(T_1 - T_2) + \cancel{v(p_1 - p_2)} + \cancel{\frac{V_1^2 - V_2^2}{2000}} + \frac{g(z_1 - z_2)}{1000} \right);$$

$$\Rightarrow \dot{W}_p = \dot{m} \left(c(T_2 - T_1) + \frac{g(z_2 - z_1)}{1000} \right);$$

$$\Rightarrow \dot{m} = \frac{\dot{W}_p}{c(T_2 - T_1) + \frac{g(z_2 - z_1)}{1000}};$$

$$\Rightarrow \dot{m} = \frac{5}{4.184(0.1) + \frac{9.81(25 - 0)}{1000}};$$

$$\Rightarrow \dot{m} = 7.5 \frac{\text{kg}}{\text{s}}$$

TEST Solution and What-if Scenario:

Launch the SL single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-94 [OOZ] Saturated liquid water at 350°C is throttled to a pressure of 100 kPa at a flow rate of 10 kg/s. Neglecting change in ke, determine (a) the exit temperature, and (b) the amount of saturated vapor produced by the throttling process.

SOLUTION

State-1 (given x_1 , T_1):

$$p_1 = 16529 \text{ kPa}; \quad h_1 = 1671 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 3.778 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given p_2 , $h_2 = h_1$, $\dot{m}_2 = \dot{m}_1$):

$$h_f = 416.51 \frac{\text{kJ}}{\text{kg}}; \quad h_{fg} = 2257.5 \frac{\text{kJ}}{\text{kg}};$$

$$x_2 = \frac{h_2 - h_f}{h_{fg}} = 0.55;$$

(a) $T_2 = 99.16^\circ\text{C}$

(b) The amount of saturated vapor produced

$$\dot{m}_v = x_2 \dot{m}_1;$$

$$\Rightarrow \dot{m}_v = (0.55)(10) = 5.5 \frac{\text{kg}}{\text{s}}$$

TEST Solution:

4-1-95 [OOK] In the above problem, steam enters the throttling valve with a velocity of 10 m/s. If the exit area is 15 times as large as the area of the inlet, determine (a) the exit velocity and (b) the vapor production rate.

SOLUTION

State-1 (given x_1 , T_1 , V_1):

$$p_1 = 16529 \text{ kPa};$$

$$h_1 = 1671 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 3.778 \frac{\text{kJ}}{\text{kg} \cdot \text{K}}; \quad v_1 = 0.001741 \frac{\text{m}^3}{\text{kg}};$$

State-2 (given p_2 , $\dot{m}_2 = \dot{m}_1$, $A_2 = 15A_1$):

$$T_2 = 99.16^\circ \text{C};$$

From energy equation simplifications

$$\dot{J}_1 = \dot{J}_2;$$

$$V_2 = \frac{\dot{m}}{\rho_2 A_2};$$

$$h_2 + \left(\frac{10}{0.0261 \rho_2} \right)^2 = 1671.0043 \frac{\text{kJ}}{\text{kg}};$$

Therefore by iteration of values of

$$h_2 \leq 1671.0043 \frac{\text{kJ}}{\text{kg}}; \quad \rho_2 \geq 0.590319 \frac{\text{kg}}{\text{m}^3};$$

From steam table at saturated gas @ 100 kPa

$$h_2 = 1612.0834 \frac{\text{kJ}}{\text{kg}}; \quad \rho_2 = 1.11457 \frac{\text{kg}}{\text{m}^3};$$

Therefore

$$(a) \quad V_2 = \left(\frac{10}{(0.0261)(1.11457)} \right) = 343.24 \frac{\text{m}}{\text{s}}$$

(b) The vapor production

$$x_2 = \frac{h_2 - h_f}{h_g - h_f};$$

$$x_2 = \frac{1612.0834 - 417.46}{2675.5 - 417.46} = 0.52907;$$

$$\dot{m}_v = \dot{m}x_2 = 5.29 \frac{\text{kg}}{\text{s}}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-96 [OOP] Refrigerant-134a enters an insulated capillary tube of a refrigerator as saturated liquid at 0.8 MPa and is throttled to a pressure of 0.12 MPa. Determine (a) the quality of refrigerant at the final state (b) and the temperature drop during this process.

SOLUTION

State-1 (given p_1 , x_1):

$$T_1 = 304.4 \text{ K}; \quad h_1 = 94.7 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given p_2 , $h_2 = h_1$):

$$T_2 = 250.6 \text{ K} = -22.4^\circ \text{C};$$

$$(a) \quad x_2 = \frac{h_2 - h_f}{h_{fg}} = 0.341$$

(b) The temperature drop during the process

$$\Delta T = 53.8^\circ \text{C}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-97 [OOU] A pipe carries steam as a two phase liquid vapor mixture at 2.0 MPa. A small quantity is withdrawn through a throttling calorimeter, where it undergoes a throttling process to an exit pressure of 0.1 MPa. The temperature at the exit of the calorimeter is observed to be 120°C. Determine (a) the quality of the steam in the pipeline. (b) *What-if scenario:* How would the result change if the exit temperature was measured as 150°C?

SOLUTION

State-1 (given p_1):

$$T_1 = 304.4 \text{ K}; \quad h_1 = 94.7 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given p_2, T_2):

$$h_2 = 2716.27 \frac{\text{kJ}}{\text{kg}};$$

(a) From the energy balance equation, we have

$$\begin{aligned} 0 &= \dot{m}(j_1 - j_2) + \dot{\mathcal{Q}}^0 - \dot{W}_{\text{ext}}^0; \\ \Rightarrow 0 &= \dot{m}(h_1 - h_2); \\ \Rightarrow h_1 &= h_2 = 2716.27 \frac{\text{kJ}}{\text{K}}; \end{aligned}$$

The quality of the steam in the pipe is

$$x_1 = \frac{h_1 - h_f}{h_{fg}} = 0.956$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. 4-1-98 [OOX] Refrigerant-12 is throttled by a valve from the saturated liquid state at 800 kPa to a pressure of 150 kPa at a flow rate of 0.5 kg/s. Determine (a) the temperature after throttling. (b) **What-if scenario:** How would the temperature change if the Refrigerant-12 was throttled down to 100 kPa?

SOLUTION

State-1 (given p_1 , x_1 , \dot{m}_1):

$$T_1 = 305.8 \text{ K}; \quad h_1 = 67.3 \frac{\text{kJ}}{\text{kg}};$$

State-2 (given p_2 , $\dot{m}_2 = \dot{m}_1$)

From the energy balance equation, we have

$$0 = \dot{m}(j_1 - j_2) + \dot{\mathcal{Q}}^0 - \dot{W}_{\text{ext}}^0;$$

$$\Rightarrow 0 = \dot{m}(h_1 - h_2);$$

$$\Rightarrow h_1 = h_2 = 67.3 \frac{\text{kJ}}{\text{K}};$$

(a) Therefore, the temperature after throttling is

$$T_2 = 252.9 \text{ K} = -20.15^\circ \text{C}$$

TEST Solution and What-if Scenario:

4-1-99 [OOC] Refrigerant-134a at 950 kPa is throttled to a temperature of -25°C and a quality of 0.5. If the velocity at the inlet and outlet remains constant at 10 m/s, determine (a) the quality at the inlet, (b) the ratio of exit-to-inlet area. (c) *What-if scenario:* How would the answers change if the velocity was 20 m/s?

SOLUTION

State-1 (given p_1 , V_1 , \dot{m}_1)

State-2 (given T_2 , x_2 , $\dot{m}_2 = \dot{m}_1$, $V_2 = V_1$):

$$h_2 = 126.18 \frac{\text{kJ}}{\text{K}}; \quad \rho_2 = 11.04 \frac{\text{kg}}{\text{m}^3};$$

From the energy balance equation, we have

$$\begin{aligned} 0 &= \dot{m}(j_1 - j_2) + \cancel{\dot{Q}}^0 - \cancel{\dot{W}_{\text{ext}}}^0; \\ \Rightarrow 0 &= \dot{m} \left(h_1 - h_2 + \cancel{\frac{V_1^2 - V_2^2}{2000}}^0 \right); \\ \Rightarrow h_1 &= h_2 = 126.18 \frac{\text{kJ}}{\text{K}}; \end{aligned}$$

(a) The quality at the inlet is

$$\begin{aligned} x_1 &= \frac{h_1 - h_f}{h_{fg}} = 0.134 \\ \rho_1 &= 273.9 \frac{\text{kg}}{\text{m}^3}; \end{aligned}$$

© 2016 Pearson Education, Inc., Hoboken, NJ. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.

(b) The ratio of exit-to-inlet area is

$$\dot{m}_1 = \dot{m}_2;$$

$$\rho_1 A_1 V_1 = \rho_2 A_2 V_2;$$

$$\Rightarrow \frac{A_2}{A_1} = \frac{\rho_1}{\rho_2} = \frac{273.9}{11.04} = 24.8$$

TEST Solution and What-if Scenario:

Launch the PC single-flow TESTcalc to verify the solution and conduct the what-if study.

The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-100 [OOV] Refrigerant-12 is throttled by a valve from the saturated liquid state at 800 kPa to a pressure of 150 kPa at a flow rate of 0.5 kg/s. Assuming the surrounding conditions to be 100 kPa, 25°C, determine the rate of entropy generation.

SOLUTION

State-1 (given p_1 , x_1 , \dot{m}_1):

$$T_1 = 305.8 \text{ K}; \quad h_1 = 67.3 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 0.248 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given p_2 , $\dot{m}_2 = \dot{m}_1$):

From the energy balance equation, we have

$$0 = \dot{m}(j_1 - j_2) + \cancel{\dot{Q}}^0 - \cancel{\dot{W}_{\text{ext}}}^0;$$

$$\Rightarrow 0 = \dot{m}(h_1 - h_2);$$

$$\Rightarrow h_1 = h_2 = 67.3 \frac{\text{kJ}}{\text{K}};$$

$$\therefore T_2 = 252.9 \text{ K}; \quad s_2 = 0.268 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

The entropy equation, applied to the overall system produces

$$\frac{dS'}{dt} = \dot{m}(s_2 - s_1) + \cancel{\frac{\dot{Q}}{T_B}}^0 + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 0.5(0.268 - 0.248) = 0.01 \frac{\text{kW}}{\text{K}}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

This work is protected by United States copyright laws and is provided solely for the use of instructors in teaching their courses and assessing student learning. Dissemination or sale of any part of this work (including on the World Wide Web) will destroy the integrity of the work and is not permitted.

4-1-101 [OOQ] Steam at 8 MPa and 500°C is throttled by a valve to a pressure of 4 MPa at a flow rate of 7 kg/s. Determine the rate of entropy generation.

SOLUTION

State-1 (given p_1 , T_1 , \dot{m}_1):

$$h_1 = 3398.2 \frac{\text{kJ}}{\text{kg}}; \quad s_1 = 6.7 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-2 (given p_2 , $\dot{m}_2 = \dot{m}_1$):

From the energy balance equation, we have

$$0 = \dot{m}(j_1 - j_2) + \cancel{\dot{Q}}^0 - \cancel{\dot{W}}_{\text{ext}}^0;$$

$$\Rightarrow 0 = \dot{m}(h_1 - h_2);$$

$$\Rightarrow h_1 = h_2 = 3398.2 \frac{\text{kJ}}{\text{K}};$$

$$\therefore T_2 = 752.7 \text{ K}; \quad s_2 = 7.0 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

The entropy equation, applied to the overall system produces

$$\frac{dS}{dt}^0 = \dot{m}(s_2 - s_1) + \frac{\dot{Q}}{T_B}^0 + \dot{S}_{\text{gen,univ}};$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = \dot{m}(s_2 - s_1);$$

$$\Rightarrow \dot{S}_{\text{gen,univ}} = 7(7.0 - 6.7) = 2.1 \frac{\text{kW}}{\text{K}}$$

TEST Solution:

Launch the PC single-flow TESTcalc to verify the solution. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.

4-1-102 [OOT] Oxygen (model it as a perfect gas) is throttled by an insulated valve. At the inlet, the conditions are: 500 kPa, 300 K, 10 m/s, 1 kg/s. At the exit the conditions are: 200 kPa, 30 m/s. Determine (a) the exit area, and (b) the temperature at the exit. Assume steady state with no heat or external work transfer, and constant specific heats. Neglect any change in ke or pe. (c) **What-if Scenario:** What would the exit temperature be if the change in ke were not neglected. (d) Discuss if the use of IG model will affect your answers.

SOLUTION

Given:

$$c_p = 0.918 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

$$R = 0.2598 \frac{\text{kJ}}{\text{kg} \cdot \text{K}};$$

State-1 (given p_1 , T_1 , \dot{m}_1 , V_1):

$$v_1 = \frac{RT_1}{p_1} = \frac{(0.2598)(300)}{500} = 0.1559 \frac{\text{m}^3}{\text{kg}};$$

$$A_1 = \frac{\dot{m}_1 v_1}{V_1} = \frac{(1)(0.1559)}{10} = 0.01559 \text{ m}^2 = 155.9 \text{ cm}^2;$$

State-2 (given p_2 , $h_2 = h_1$, $\dot{m}_2 = \dot{m}_1$, V_2)

(a) Since the throttling is isenthalpic

$$h_2 - h_1 = c_p (T_2 - T_1);$$

$$\Rightarrow 0 = c_p (T_2 - T_1);$$

$$T_2 = T_1 = 300 \text{ K}$$

(b) The exit area follows as

$$v_2 = \frac{RT_2}{p_2} = \frac{(0.2598)(300)}{200} = 0.3897 \frac{\text{m}^3}{\text{kg}};$$

$$A_2 = \frac{\dot{m}_2 v_2}{V_2} = \frac{(1)(0.3897)}{30} = 0.01299 \text{ m}^2 = 129.9 \text{ cm}^2$$

TEST Solution and What-if Scenario:

Launch the PG single-flow TESTcalc to verify the solution and conduct the what-if study. The TEST-code for this problem can be found in the TEST-Pro site at www.thermofluids.net.
